UNLOCK REPUTATION

The Currency of Collaboration

Roy Persson, MBA

roy@unlockreputation.com ~ 646-942-6714

Core Message

Reputation is widely regarded as one of an organization's most valuable assets, yet few institutions understand what it is or how it works. While branding, finance, and human resources have established their own functions, resources, and authority, reputation remains scattered across departments, often treated reactively as a communications problem. This happens because reputation is misunderstood. It is not something that can be bought or controlled. It is a social system through which people judge an organization's conduct and decide whether to support it or stand in its way. Until institutions recognize this distinction, reputation will continue to lack the identity, authority, and resources needed to manage it effectively.

Guiding Principle

Reputation is a complex human social system, but a simple way to understand its value is to think of it as a currency. A strong reputation gives an institution a favorable exchange rate, earning greater collaboration from its stakeholders. A weak reputation diminishes that exchange rate, increasing resistance and the cost of doing business.

About the Author

For over 20 years Roy Persson has advised Fortune 500 companies on reputation, public trust, and institutional legitimacy. His work sits at the intersection of corporate leadership, public affairs, and societal accountability, guiding senior executives as they navigate regulatory scrutiny, activism, crisis, and long-term reputational risk. He has developed multi-stakeholder reputation frameworks that translate values, trust, and evolving expectations into practical guidance for leadership decision-making across complex institutional environments.

A Personal Word from the Author

If you're reading this from inside a large-scale institution, especially a major modern corporation, I want to speak to you directly. This book is not written about you from the outside. It's written with you in mind. I know the environment you're operating in. I've sat in the rooms where every word is weighed for risk. I've watched smart, principled people navigate competing pressures from employees, regulators, customers, investors, and political actors. You are living in the hardest time in corporate history. The Reputation Era.

I'll be honest. There were moments I considered not writing this book. Not because the issues felt unresolvable, but because speaking plainly about corporate reputation right now carries real personal and professional risk. In our current environment, even structural analysis of institutional pressure is easily read as accusation. But silence carries its own costs. When we move toward risk avoidance, the burden falls on the professionals inside the organization and society alike. It leaves an already dysfunctional reputation operating system in disrepair.

This book is written in good faith. With fairness, curiosity, and responsibility toward both institutions and society. It is not an indictment of corporate leaders. If anything it paints a picture of executives caught in a complicated, conflicted, and paradoxical world that they have suddenly become highly accountable to. This book is not a manifesto demanding institutions perform virtue or pick sides. It is a structural diagnosis of the pressures they face and the systems that interpret those pressures.

However, some of what follows will feel uncomfortable. Because this book operates from a simple premise. Power and responsibility are intricately linked. That shouldn't be unsettling, but it forces us to consider a hard question. Are our choices actually building the trust we say we need, or are we engaging in behaviors to buy just enough time to achieve our next short-term goal?

The chapters that follow examine how reputation is formed, stressed, and misunderstood inside and outside our institutions. This is where the work begins. Thank you for taking the journey.

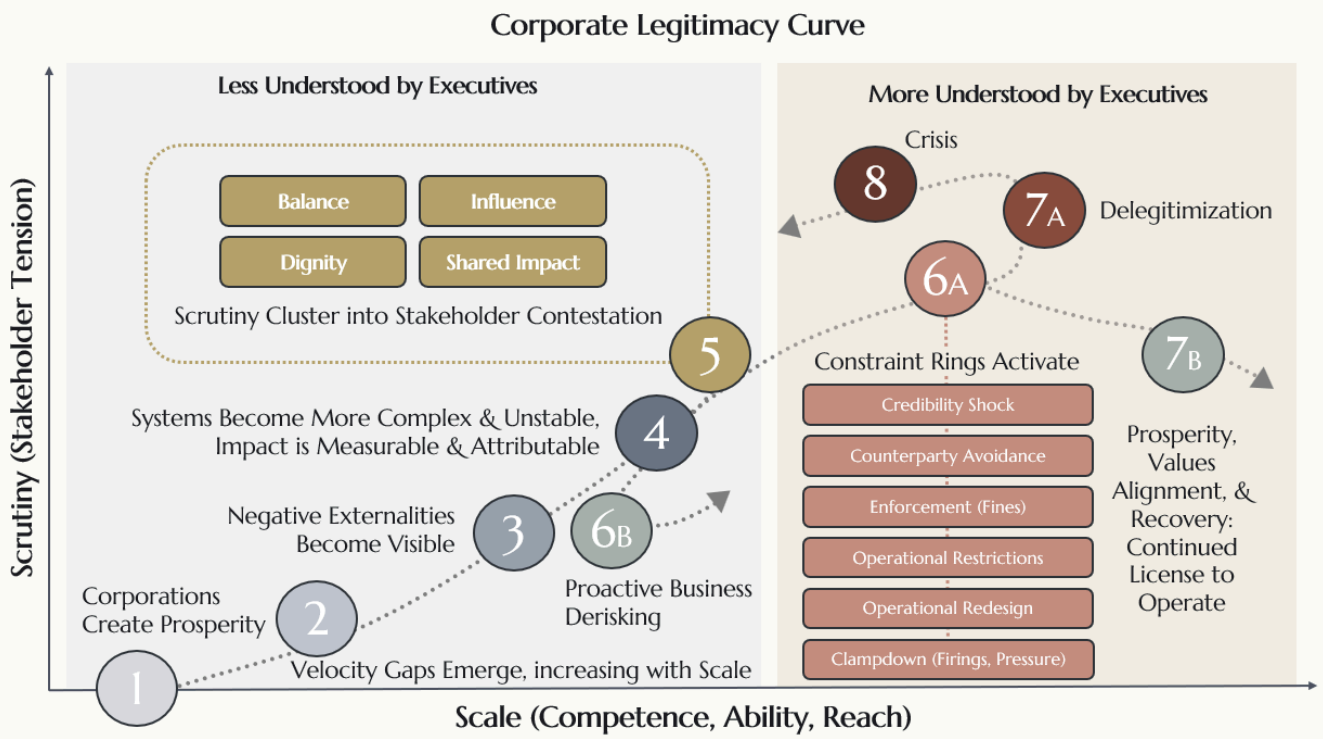
The Napkin Visual: Book Spine and Organizing Architecture



The Corporate Legitimacy Curve serves as the visual structural spine of Unlock Reputation. It is the guiding architecture on which the entire argument rests. The first three chapters deconstruct each element of this model in granular detail, through historical analysis and empirical case studies. Early in the book the reader moves from abstract mechanisms to concrete examples, building an intuitive understanding of why business growth without alignment generates reputational risk. The remainder of the book expands outward from this foundation, explaining reputation as a concept that is highly conflated in the modern business era. Middle portions of the book explain what reputation actually is and what it is not. While later portions of the book transition to strategic guidance, providing executives with frameworks for embedding reputational foresight into governance, decision-making, incentive design, and stakeholder engagement.

Please note that the perspectives and analysis in this book are my own, based on my professional experience advising institutions over two decades. They do not represent the views, opinions, or positions of any of my former employers or clients.

Section 1: Tides of Change: Key Reputation Trends in a Transforming World

Quote Text (Placed on the section break page): *"We are not makers of history. We are made by history." — Martin Luther King Jr.*

Chapter 1: The Tension of Corporate Power

Passage 1: The Impact of Global Enterprise

Summary Text (Not Included in Final Copy): Corporations were built to deliver prosperity and scale, which they did spectacularly, earning a shield from scrutiny as long as stakeholders felt the benefits. But the speed at which they moved, innovated, and scaled created velocity gaps where regulation, risk management, and human understanding couldn't keep pace. Companies succeeded at their core mission while simultaneously creating consequences they couldn't anticipate, making their competence their greatest vulnerability. The prosperity that once enabled institutions to obtain legitimacy now faces intensified scrutiny. We now live in the Reputation Era, where reputation is quickly becoming the primary currency through which institutions can sustain their license to operate.

DOWNLOAD THE BOOK PROPOSAL

In 2008, the American federal government authorized $700 billion for a troubled asset relief program (TARP) for the banks that had just collapsed the American economy.[1] In the same week, millions of households faced foreclosure.[2] The banks, it was decided, were too important to fail. The families who felt the financial impact were not. No meaningful scandal emerged. High profile executives did not receive jail time.[3] Within months, bonuses resumed. Yet from that moment forward, it was not business as usual. The ground society stood upon was becoming increasingly uneven. Modern day systems would reward the architects of collapse, while leaving ordinary people in a survival game.

Leading up to this point, scrutiny of society's largest institutions was already an ambient glow. The G7 summit, a small coalition of advanced economies coordinating on global issues, had drawn sustained public opposition across Europe since the 1980s.[4] Davos, the annual gathering of global political and corporate leaders, became a focal

point for organized dissent and criticism throughout the 1990s.[5] At the same time, environmental concerns were scaling into global coordination efforts, culminating in the United Nations Earth Summit.[6] That shift was shaped in part by earlier moments when the consequences of industrial growth became visible, including the 1969 river fire in northeastern Ohio.[7]

The financial failure in 2008 would be different. It served as a unique event that fundamentally shifted how the world viewed institutions. Not because the event showed harm, but because it revealed that it was not a sudden localized episodic failure. It marked a point of clarity after centuries of accumulating structural misalignment. It was the shocking force of compounding corporate velocity. It struck both physically and emotionally. Its reach landed beyond local communities, propagating globally. The lesson provided more than an understanding that velocity carries consequences, it taught the world that those consequences were already deeply embedded into nearly every facet of their lived experience. The problem was no longer in someone else's backyard, or river. The issue was no longer a societal challenge that would manifest in tragedy on someone else's clock. The reality became

clear, inescapable, and hard to ignore. The systems that provided society with growth and prosperity were both highly unstable and uneven.

Banks had leveraged risky assets as fuel to expand mortgage lending which increased homeownership and home prices.[8] These actions injected society and economic systems with prosperity. But what was under the foundation of these homes was risk, far greater than a weak credit rating. It was systemic risk, where consequence could be shifted downward while elevating protection upward. Systemic risks that emerged from velocity gaps. The speed capital moved at was outpacing every guardrail designed to oversee it. Information was moving faster than understanding. Threats to communities were measurably greater than what they could absorb. Regulation and risk management was either absent, or unable to keep pace. Velocity gaps are what happens when adaptation, innovation, expansion, commercialization, and information exceeds comprehension and conformation. When these velocity gaps converge, systems become unstable. And when systems become unstable, they typically collapse. The larger and more complex the system is, the greater the consequences. Velocity gaps have always been there, for hundreds of years, but now they are magnifying and becoming globally interconnected. Global prosperity could now be seen as being directly connected to global vulnerability.

---

[8] *Crisis and Response: An FDIC History, 2008–2013*. (n.d.).

This vulnerability was not intentionally planned, the plot arranged by a malicious clandestined group of institutional actors. To the contrary, corporations were executing as they were expected to act and they were doing so with remarkable competence. Banks, like any other industry, were intentionally acting with a primary objective in mind, which is to drive shareholder returns while delivering prosperity.[9] To do so banks became engines of complex financialization strategies through the latter part of the twentieth century.[10] The corporation was perfectly designed to do this, but what they were not designed to do was absorb the social consequences of those strategies. Corporations had proven that innovation, scale, and reach could deliver extraordinary economic resilience and shareholder returns. As they scaled it was assumed that business competence would naturally include self-governance features that would prioritize societal stewardship. That assumption, which was already under pressure from anti-corporate protests and escalating environmental concerns, shattered with the rise of home foreclosures resulting from the 2008 financial crisis.

Millions of foreclosure signs were staked out in front of homes. Looking out the front window, communities didn't see the word foreclosure, they saw a chilling modern day

understanding. *"In the modern world, what corporations do with their power matters more to our society than it ever did before."* That visibility began to reshape the interpretation of institutional power. And it raised a question that would define the coming era, "*How can corporations operate at a scale without losing the ability to foresee and manage the potential consequences of that scale?"*

Institutions have failed before. But 2008 was different in scale and velocity. It was the first time a collapse happened globally and instantaneously, exposing velocity gaps across every interconnected system at once. The signals that the reputation operating system was failing were becoming increasingly visible for about 100 years before the 2008 mortgage crisis sent its shockwaves through society. Ironically, the earliest cracks in the system were commonly taught in history books for nearly 500 years. How could signals that eventually led to a global financial meltdown accumulate for centuries, yet remain invisible? It remained out of sight, because these signals of breakdown were camouflaged by perceived prosperity. This becomes a uniquely defining quality of the 2008 financial crisis. It was more than a breaking point, it gave the signals of reputational failure clarity. It revealed that the systematic engineering of prosperity did not include the required mechanics to mitigate or prevent consequence. And when consequence is visibly greater than prosperity, scrutiny always follows.

DOWNLOAD THE BOOK PROPOSAL

What unfolds is the greatest paradox of the modern era. Corporations are being held to standards of accountability, to shield society from consequence, which they were never purposefully designed to meet. While simultaneously being asked to do what they were designed to do, act as engines of scale. To achieve this scale firms prioritize efficiency, optimization, speed, cost reduction, and profit seeking maximization. Corporations built the scale that society demanded, granting prosperity which advanced societal wellbeing. The tension arrives when corporations succeed at their core mission, while creating consequences they could not always anticipate. Leaving businesses to face stakeholder scrutiny for societal externalities they did not intentionally design. Companies are failing precisely when they are succeeding. Their competence has become their vulnerability. As a result, modern day business success carries risk which is often delayed and not easily detectable, but the risk is always present. This is the contradiction at the center of modern day corporate life. The relationship between institutional trust and performance not only began to separate, but the gaps between the two further accelerated.

But this paradox contains an ironic twist. Corporations are highly innovative institutions capable of delivering convenience, quality, and technological advancement at remarkable scale. They do more than solve problems; they translate new possibilities into forms of prosperity that people can experience in their everyday lives. That prosperity historically produced institutional acceptance. When

DOWNLOAD THE BOOK PROPOSAL

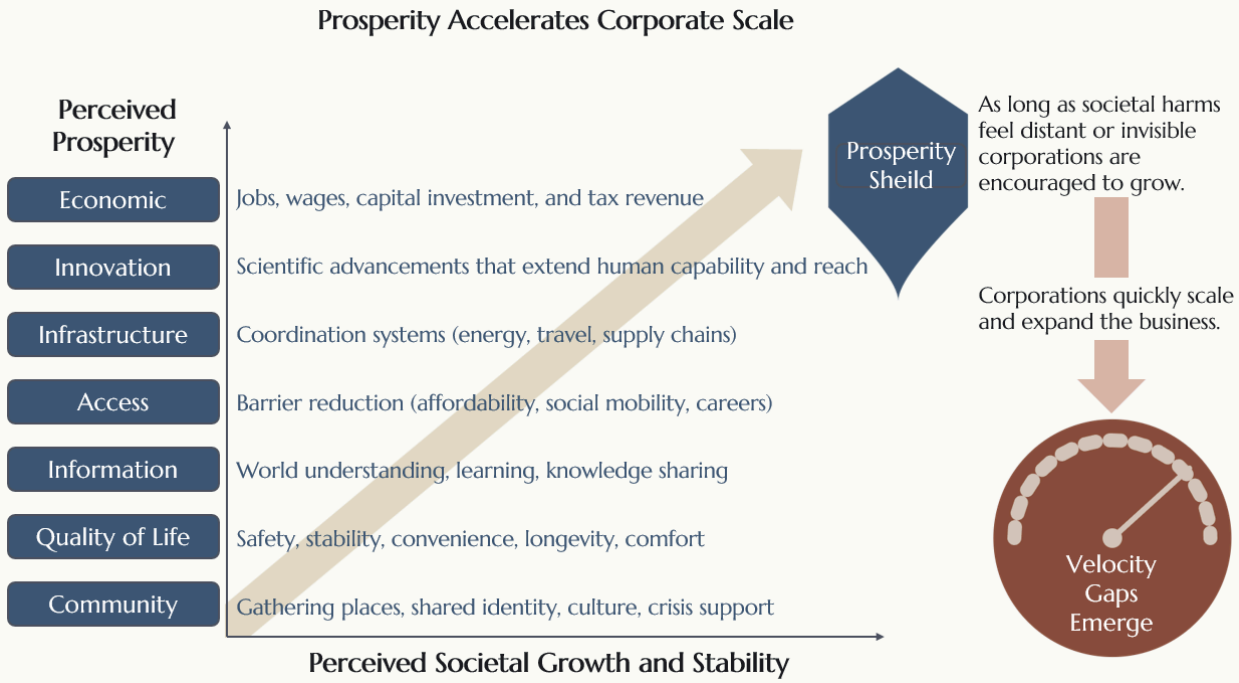
stakeholders believed corporations were improving lives, strengthening communities, and advancing society, they granted those institutions the support and permission needed to continue operating and expanding. This continued acceptance is legitimacy. When earned through prosperity, legitimacy does more than provide permission to operate. It strengthens institutional resilience and creates a shield from scrutiny.

Two conditions sustained this prosperity shield. First, stakeholders had to experience tangible benefits through jobs, access to goods and services, infrastructure, convenience, or innovation. Second, the consequences of corporate activity had to remain distant, diffuse, or invisible. When both conditions held, corporations could expand with limited resistance. Greater acceptance enabled greater scale, accelerating adaptation, innovation, commercialization, expansion, and information gathering.

But this rapid growth has the propensity to create velocity gaps, moments where institutional capability advances faster than the systems required to comprehend its effects, govern its expansion, and align it with societal expectations. As witnessed throughout history, and most visibly during the 2008 financial crisis, when these velocity gaps converge, systems become unstable. When systems become unstable, they become vulnerable to collapse. The irony becomes clear. The prosperity shield

DOWNLOAD THE BOOK PROPOSAL

that enables corporate expansion also creates the conditions for greater societal consequence and scrutiny. Companies celebrated as heroes can succeed long enough, and scale far enough, to become villains within the same plot.



Prosperity should not be viewed as the culprit, it should be understood as an essential component of societal structure. It should be further understood as a multifaceted societal benefit ecosystem, one that corporations have played an important role in creating for over 1000 years. The corporation was purposefully designed to be powerful engines of technological advancement, transforming advances in science, medicine, and infrastructure into solutions that reach deep into society. As society advanced, so too did the prosperity that corporations delivered. From pharmaceutical

DOWNLOAD THE BOOK PROPOSAL

breakthroughs that extend life expectancy to digital platforms that democratize access to information and financial services, they moved scientific possibility into lived reality. They've also proven to be highly effective at delivering economic prosperity through the jobs, wages, and capital investment which sustain livelihoods and bolster communities. Prosperity is felt through enormous infrastructure that makes modern life operable at scale through energy networks, logistics systems, supply chains, and digital networks that connect billions of people and enable instant coordination across time zones. The reach of this prosperity feels both instantaneous and limitless, delivering access and reach through global distribution that reduces friction between supply and demand, expanding participation across geographies that once would have been unreachable.

These outcomes of modern day prosperity did not emerge from small systems. They required capital concentration, global coordination, and operational complexity that only large enterprises could sustain. Consider the transformation that has occurred in just the last century. Back in the 1600s, global trade was dominated by sailing ships operated by companies like the British East India Company, where voyages required months, enormous capital risk, and close alignment with state authorities.[11] Over time, the rise of market liberalization, capital mobility, and modern information systems

DOWNLOAD THE BOOK PROPOSAL

scaled trade and innovation globally. By connecting markets, standardizing systems, and enabling cross-border exchange, corporations dramatically reduced the barriers of time and distance. Today, complex medical innovations developed in one country can be deployed globally within years, or even months. This compression of time and distance is what makes modern life possible and what fundamentally shaped how society became dependent on the prosperity that corporate scale creates.

Beyond creating goods and services, corporations have demonstrated remarkable capacity for community and social support during moments of crisis as well. When disasters strike, modern corporations often possess the operational capacity to act faster than governments can mobilize. During Hurricane Katrina, large retailers like Walmart restored supply chains and delivered essential goods more rapidly and effectively than federal agencies could.[12] During COVID-19, companies compressed years of digital transformation into months, with McKinsey research showing that organizations discovered they could move up to 40 times faster than they believed possible before the crisis.[13] They shifted to remote work in weeks, migrated operations to the cloud, reconfigured supply chains, and supported vaccine distribution, food

security, and medical supply protection. When the 2024 Hualien earthquake struck Taiwan, killing at least 17 people and causing widespread damage, Foxconn donated $80 million in relief and mobilized its logistics network to support affected communities.[14] These moments show what corporations can accomplish when they commit resources and capability to collective societal welfare.

This is the prosperity that stakeholders demanded from corporations as they scaled. Stakeholders recognized corporations were engines of economic growth, community stability, technological advancement and infrastructure enablement. Companies became the conduit between invention and impact, the drivers of growth and societal stability. Many of the advancements enjoyed on a day to day basis would not be possible without the evolutionary success provided by corporate scale.

Yet it is precisely this unprecedented evolutionary success that leads to the contradiction at the center of modern corporate life. The same scale, reach, speed, and coordination that enable extraordinary progress have amplified missteps and ethical blind spots. The positive impact these companies offer society is in a state of conflict, challenged by perceptions of corporate greed and well-documented negative externalities on communities and the environment. A skeptical public has become accustomed to a range of corporate scandals. Canonical examples of fraud,

such as Enron in 2001, unfolded in full public view. While lesser-known overcharging schemes by Corporate Travel Management that led their founding executive Jamie Pherous to step down.[15] The impact of the corporation in the Reputation Era goes well beyond making products that meet market needs. Corporations now operate deeply within the systems that deliver prosperity, but those same systems can also produce velocity gaps and far-reaching societal consequences. For much of corporate history, the successful delivery of prosperity provided the dominant basis on which legitimacy was granted. Ironically, as legitimacy enabled prosperity and corporate scale to expand, that increasing scale became the backdrop for crisis-inducing scrutiny. This is the context of the Reputation Era, a time in which corporate success does not reduce scrutiny; instead it intensifies it. The more powerful corporations become, the more society expects them to safeguard the power they create.

The 2008 financial crisis ushered in the Reputation Era because it made the gaps between corporate competence and corporate accountability not only visible, but hard to ignore. The Reputation Era would redefine corporate risk from concerns of scandal or moral failure, to systematic structural instability. The financial crisis became an undeniable proof point that when systems that move faster than they can be governed, they create negative externalities that accumulate until they become

DOWNLOAD THE BOOK PROPOSAL

visible. And once externalities are attributed to an institution, society begins asking harder questions. Are the benefits fairly distributed or concentrated? Is power being exercised responsibly or exploited? Are people being treated with dignity or as disposable? Are the costs of growth being shouldered by those who profit, or transferred to communities and ecosystems that bear no responsibility for creating them? These questions, once raised, do not fade away. They accumulate over time, creating pressure that narrows the space in which a corporation can operate. Partnerships begin to dissolve, credibility weakens, and regulatory tolerance shrinks. A company's license to operate becomes increasingly conditional. What begins as scrutiny gradually transforms into constraint, creating vulnerabilities that accelerate delegitimization and can ultimately become existential threats to the institution itself.

Today's society, growing ever more conscious and globally connected, wakes to the Reputation Era's most unavoidable question: *"Can I trust companies with the increasing influence and power that the modern corporate ecosystem provides?"* This question sits at the center of corporate legitimacy in the modern era. A question that lands because corporations are now more powerful than they ever have been before. A question that will rise more frequently and aggressively because corporate power is more visible and easily contested. This question arrives because today's systems feel fractured, uneven, and highly unstable. In this environment, legitimacy is no longer secured through economic performance alone. It is continuously negotiated as

DOWNLOAD THE BOOK PROPOSAL

stakeholders evaluate institutions through the lenses of prosperity, desirability, and, increasingly, integrity. Reputation is the currency that carries and consolidates those judgments. What was once viewed merely as a communication tool or brand asset has become something far more vital to institutional longevity. In the Reputation Era, reputation determines whether an institution's conduct is interpreted as worthy of continued acceptance and whether its license to operate is strengthened, contested, or constrained.

Passage 2: Making the Reputation Era

Summary Text (Not Included in Final Copy): Over two thousand years, corporations evolved from local civic organizations into global forces capable of shaping geopolitical systems. With each era, from Ancient Rome through the Industrial Revolution to today, corporate scale and power expanded faster than society could build the accountability and interpretive mechanisms needed to evaluate and oversee them, creating persistent velocity gaps. Early corporations earned legitimacy through competence, prosperity, and proximity, but as they grew larger, faster, and more complex, the relationship between performance and accountability fractured. Journalism briefly provided a shared system through which corporate power and its consequences could be interpreted. But digital fragmentation, combined with the weakening of regulatory, journalistic, and democratic authority, left reputation as the primary mechanism through which stakeholder judgments could be consolidated and

DOWNLOAD THE BOOK PROPOSAL

legitimacy granted or withheld. The Reputation Era marks a structural condition in which corporate power is unprecedented and increasingly unmediated, requiring legitimacy to be earned through more than competence and prosperity alone.

The question of whether companies can be trusted with their influential scale results from changes that have been building over 2000 years. It evolved through a series of structural expansions that reshaped the institutional incentives, the speed they operate at, the reach of their influence, and how consequences from their decisions are distributed. These changes would take place over centuries, all of which would contribute to the most significant evolution in corporate history. Over the past 100 years the rules of how legitimacy is granted to business, the reputation operating system, would fundamentally change.

To understand the Reputation Era, it is not enough to examine the present moment. The conditions that define it were constructed gradually, across different periods of economic and institutional development. What changed was not the fundamental purpose of the corporation, its purpose would always be to produce prosperity. What evolved with each era was the introduction of new capabilities and new mandates that would introduce new velocity gaps. With each velocity gap the relationship between performance and accountability would separate. With each velocity gap, the

DOWNLOAD THE BOOK PROPOSAL

potential for societal consequences emerged. With time these shifts started to produce a consistent visible pattern. Corporate capacity expanded faster than the systems designed to interpret, oversee, and legitimize that expansion. The result was not immediate breakdown, but accumulating strain that now constricts institutions in the modern era. To understand how this pattern formed, we need to examine how the systems through which corporate legitimacy was granted and sustained were built, what assumptions they carried, and where they began to fracture.

The pattern begins in ancient Rome. This period, the Ancient Civic Era, marks the first time corporations received legal recognition as entities (collegia and universitates) that could exist independently of the individuals who composed them.[16] These early corporate forms organized trades, religious orders, and civic works. What distinguished this era was the fusion of economic and civic mandates. Corporations generated prosperity while maintaining roads, managing public works, and structuring social order. Scale mattered fundamentally. Geographic reach was limited. The speed of commerce was constrained by physical distance. A merchant who profited from the community also lived in it. Consequences of the merchants' decisions were visible. As a result, proximity served as a mechanism for accountability.

[16] Patterson, J. L. (1983). The Development of the Concept of Corporation from Earliest Roman Times to A.d. 476. *The Accounting Historians Journal*, *10*(1), 87–98.

DOWNLOAD THE BOOK PROPOSAL

Legitimacy flowed from the alignment of prosperity. If a corporation organized economic activity and contributed to collective welfare, it earned the right to continue operating. This assumption held because distance between power and consequence was minimal. Those organizing economic activity naturally understood their role in organizing society. In this time period the market and community were not treated as separate domains.. This is because the reputation operating system of the Ancient Civic Era recognized that visibility was direct and impact was local. This would not hold up thousands of years later.

Much of what was expected from, and how corporations acted in society, remained largely the same for 1000 years. That is, until the Medieval Guild Era. At this point, corporations evolved into formalized guilds and chartered towns, they became more sophisticated in how they created prosperity. These institutions showed their ability to translate economic activity in societal structures by creating rapidly growing urban centers. Guilds brought together merchants and craftspeople within specific trades. They established rules around production, apprenticeship, training, pricing, and market participation.[17] But what made guilds transformative was not its economic organization, it was the creation of class structures based on skill rather than birth.[18] A

[17] Ogilvie, S. (2014). The Economics of Guilds. *Journal of Economic Perspectives*, *28*(4), 169–192. https://doi.org/10.1257/jep.28.4.169

[18] *Medieval Guilds—World History Encyclopedia*. (n.d.). Retrieved May 6, 2026, from https://www.worldhistory.org/Medieval_Guilds/

DOWNLOAD THE BOOK PROPOSAL

person could rise from peasant to master craftsman through competence and learning. While common in modern society, this was a revolution of its time. For the first time, economic position became linked to occupation and ability rather than solely to land ownership or lineage. Guilds determined who could learn, who could earn, and who could advance. They created structured wages, standardized training, and controlled access to participation within the urban economy.

The prosperity the corporation would provide society in the Medieval Era evolved significantly, but what did not change, materially, was its reach and proximity. Guilds operated within defined geographies. A guild's legitimacy was rooted in the community it served. The master craftsmen knew the apprentices and guild halls typically existed in just one city. Accountability remained both local and visible. When a guild maintained standards, those standards were enforced by neighbors and competitors who could see the work. Like the Ancient Civic Era, this local embeddedness made legitimacy straightforward. The guild that organized economic activity fairly, maintained quality, and contributed to community welfare earned the right to continue their business operations.

The next corporate evolution, in the 1600s, occurs 500 years later. The Chartered Era provided a blueprint for instability that would repeat consistently right up to the 2008 financial crisis. However, the velocity gap that emerges in this era doesn't take

DOWNLOAD THE BOOK PROPOSAL

place at a bank, it transacts on merchant trading ships. Historical accounts typically spotlight the Dutch and British East India Trading Companies as the beginning of the modern corporate form, this framing holds merit in many ways. These companies supported advanced overseas trade and colonial expansion networks that combined private capital with state authority to manage risk and scale commercial ventures.[19] They introduced organizational features that remain foundational today such as joint stock ownership, which allowed capital to concentrate without individual investors bearing total liability. Continuity beyond individual investors also meant the enterprise could persist regardless of who owned it.[20]

But what truly distinguished the Chartered Era was a fundamental shift in how corporate power became mobile. Now corporations spanned jurisdictions, crossing oceans, to govern overseas territories. They also functioned as hybrid entities, part commercial enterprise and part governing authority, empowered to manage overseas territories, raise armies, collect taxes, and negotiate on behalf of the state.[21]

DOWNLOAD THE BOOK PROPOSAL

Advances in mobility, which repeated through history, is a corporate velocity gap. Its ability to undermine and threaten legitimacy would endure to the modern era. The mobility of corporate power spanning continents combined with a role to act as a governance structure, rendered accountability at best confused, and at worst completely unaccounted for. Who is responsible for a corporation operating in a distant territory as both merchant and governor? The home nation? The colonial authorities? The corporation itself? There was no accountability structure that could reach across jurisdictions to verify that power was being exercised responsibly. From this point onward, corporations were no longer confined to organizing local economic activity. Mobility gave them reach, making them instruments capable of shaping global trade, redrawing geopolitical maps, and establishing complex resource distribution across continents. Power escaped local oversight and the assumption that local accountability structures could suffice had broken, this structural problem would echo through each subsequent era, right into the modern era.

The Industrial Era marks the next evolution of the corporation. Advances in technology accelerated the speed at which goods, capital, and information could move, introducing early forms of what would become persistent velocity gaps. By the 1800s, large corporations, including textile manufacturers, steel producers, and railroad operators, concentrated labor, capital, and machinery at unprecedented

DOWNLOAD THE BOOK PROPOSAL

scale.[22] Breakthroughs in energy and transportation connected regions that had previously been isolated, compressing distance and redefining coordination across markets. The transcontinental railroad, built within decades, did not simply expand commerce. It reshaped expectations around scale, speed, and reach.[23]

A new form of misalignment emerged in the form of a regulatory velocity gap. Corporations scaled rapidly, often faster than negative externalities could be understood and governance could adapt. Waves of innovation increased not only the capacity to connect, distribute, and scale, but also the capacity to compound consequences. What appeared in the Industrial Era as physical acceleration in transportation and logistics would, centuries later, surface as structural fault lines in financial systems leading up to the 2008 mortgage crisis.

But the scale and speed at which companies operated in the Industrial Era also led to increasingly tangible prosperity as well. This logistics transformation shrank world distances. Raw materials, goods, and people moved faster and farther than ever before. Like earlier corporate forms, Industrial Era corporations reshaped where people lived and how cities grew, while becoming an increasingly vital component of national economies. Prosperity widened as parallel advances in medicine and public

health led to breakthroughs in sanitation, vaccination, and surgical practice. These advances contributed to declining mortality rates and longer lifespans in industrializing societies.[24] The evolution of the corporation made it a force capable of shaping not only economic outcomes, but the pace and direction of societal change. Despite the ability for some corporations to scale beyond existing policies and governance frameworks, communities embraced corporate expansion because the prosperity was real, immediate, and highly transformative.

The regulatory velocity gap became increasingly visible as companies moved across more regions and jurisdictions. Governance struggled to keep pace, if they could at all. Companies began to operate in “grey spaces,” expanding faster than oversight and governance mechanisms could be established. The speed at which corporations could move, innovate, and enter new markets outpaced the ability of regulatory systems to respond. That power, once constrained by local oversight and structured governance

DOWNLOAD THE BOOK PROPOSAL

systems in earlier eras, became far more difficult to contain. While the prosperity was undeniable, so was the velocity gap that enabled it. This structural misalignment would accumulate for centuries, eventually leading to moments of systemic global consequence.

Additional misalignments would continue in the New Dawn Era. A time where the most advanced corporations began to scale beyond what any single person could either oversee or fully comprehend. By the early 1900s, the corporate problem was no longer about learning how to build big, it was about having a full informational picture about what was built. From this point forward it would become increasingly commonplace that a manufacturing decision, that was made in a corporate headquarters, could ripple across factories, supply chains, and communities that executives would never visit, or potentially even knew existed. The information required to understand the full scale of consequences of those decisions simply could not travel that far backward through the organization.[25] Corporations were showing the earliest signs that rapid, highly accelerated scale would have informational blind spots. This resulted in corporations making decisions that created harm, but could not be fully anticipated in places, or future times, they could not see. This information velocity gap, where decisions are made without access to their consequences, would

DOWNLOAD THE BOOK PROPOSAL

become the blueprint for what would repeat throughout the next century, most visibly in the banking system that would be shocked by the mortgage crisis a hundred years later.

But blindness, in an ironic twist, creates an opportunity. Journalists began investigating what corporations either could not see, or thought the broader public did not understand. Ida Tarbell, a journalist, spent years tracing Rockefeller's Standard Oil decisions that led to significant economic and workforce consequences.[26] Ida pioneered muckraking journalism, which brought distant, hard to understand, harms, like monopolies, into visibility.[27] For the first time, the societal consequences of corporations had broad public witnesses. Visibility was magnified beyond those directly afflicted. Visibility forced a new dynamic, corporations had to answer to a new set of reputational stakeholders, the media, regulators, and an increasingly informed public. Maintaining legitimacy required dialogue with a broader set of stakeholders.

Visibility was the most powerful force unleashed in the New Dawn Era because it revealed that competence no longer guaranteed legitimacy. A company could be

DOWNLOAD THE BOOK PROPOSAL

efficient, profitable, and innovative, and still face scrutiny for consequences it had not foreseen. The decoupling had begun. At this point it was becoming understood that competence delivered prosperity, but competence was also recognized as delivering hidden consequences. It would take the global reach of the 2008 banking crisis to bring this lesson back to shocking reality. With each decade leading into the Reputation Era, visibility of negative externalities would only increase and expand. Scrutiny followed, society would begin asking a harder question. "*Can our corporations be trusted to safeguard our society?"* The historical baseline for protests against global institutions at G7 and Davos a century later had been set. The reputation operating system, which had functioned for centuries on the assumption that competence and legitimacy moved together, was beginning to show its first cracks.

The next evolution takes only fifty years. The second half of the twentieth century marks the Unbounded Era. A time where corporations reached significant global expansion, defined by increased physical scale, capital mobility, global geographic reach, and information technologies which created complex interconnected business, social, economic, and political systems. Advances in computing, digital communication, and the internet fundamentally altered how corporations operated and how they were perceived. Corporations were making the world a highly interconnected place, if one economic system or supply chain failed the consequences

DOWNLOAD THE BOOK PROPOSAL

could be catastrophic. Because scale was also increasingly becoming "blind", the extent of the fallout could be predicted, but never fully understood until the consequences occurred.

As systems became interconnected, visibility also increased dramatically as well. In the Unbounded Era corporate actions, once obscured by slow-moving news cycles and buried deep within organizational walls, became more visible through increased news and media exposure across a full range of reputation stakeholders such as employees, consumers, investors, regulators, and the public at large.[28] But this did not hold for long. Within this same time period the information system itself fractured. Digital platforms and algorithmic sorting split audiences into different realities. Now corporations became visible for negative externalities, but this visibility came without consensus. Media, activists, regulators, and the public all saw the same actions through different lenses. The information velocity gap that had briefly narrowed became scrambled. Shared understanding of corporate consequences was dissipating.

Another shock to stability during the Unbounded Era came in the form of financial and political frameworks, spearheaded by concepts like Milton Friedman's shareholder primacy.[29] This framework redirected corporate decision-making away from

DOWNLOAD THE BOOK PROPOSAL

stakeholder balance and toward short-term financial profit maximization. It shortened time horizons, prioritizing immediate returns over long-term consequence management. Financial deregulation accelerated capital flows and merger activity.[30] The change in corporate incentives set the stage for advanced financialization techniques that increased tolerance for risk taking.

The Making of the Reputation Era

Ancient Civic & Medieval Guild Era 0 – 1500s	Chartered Era 1600s	Industrial Era 1800s	New Dawn Era 1900	Unbounded Era 1950
Close proximity and visibility ensured accountability. Over time accountability would fragment with **velocity gaps** and **negative externalities** would become visible.	Velocity Gaps			
	Mobility Distance blurs accountability	**Governance** Scale exceeds governance safeguards	**Information** Scale and complexity becomes obscure	**Capital** Digitization, globalization, financialization
	Externality Reckoning			
	Coercive labor, resource extraction from overseas regions Localized, not fully understood	Unsafe working conditions, pollution in industrial centers Partially visible, often delayed	Monopolies, unsafe products, deceptive marketing Increasingly visible via journalism	Supply chain abuses, financial risk taking, global environmental harm Highly visible, but fragmented narratives

Velocity Gaps A structural mismatch where the speed of corporate scale (mobility, governance, information, capital) exceeds the speed of the systems designed to interpret, govern, or legitimize it.

Externality Negative externalities occur when the societal costs of corporate activity are distributed beyond the firm, which translates to either hidden or blind consequences for stakeholders.

The result was 500 years of systematic misalignment. Information systems fragmented into incompatible narratives. Capital moved at velocities that regulation

could not contain. Corporations operated at scale where visibility could not fully penetrate. No shared reality existed to evaluate what corporations were doing. Mechanisms for institutional trust were deteriorating. The reputation operating system, which had already fractured in the New Dawn, had broken completely. But nobody knew it yet, that is until the 2008 financial crisis would make this reality clear.

This set the stage for the Reputation Era, a moment unlike any other in corporate history. Corporations had accumulated unprecedented power, reach, and influence through exponential growth that dwarfed even the most recent Unbounded Era. Yet this moment of extraordinary corporate power coincided with widespread institutional delegitimization. Every mechanism that had once mediated corporate legitimacy fractured simultaneously.

Regulation could not keep pace with corporate velocity. Journalism fragmented across competing narratives and lost institutional authority.[31] Democratic institutions lost credibility. Digital platforms shattered shared reality into incompatible versions. Corporations became hyper-visible, but no single institution could mediate what that visibility meant. In previous eras, when corporate scale outpaced the systems responsible for oversight and interpretation, society often had time to construct new

[31] Di Martino, E., Galeazzi, A., Starnini, M., Quattrociocchi, W., & Cinelli, M. (2025). Ideological fragmentation of the social media ecosystem: From echo chambers to echo platforms. *PNAS Nexus*, pgaf262. https://doi.org/10.1093/pnasnexus/pgaf262

DOWNLOAD THE BOOK PROPOSAL

forms of accountability. Regulation would eventually catch up. Journalism would eventually expose consequences. Democratic institutions would eventually mediate disputes. But in the Reputation Era these systems weakened simultaneously. There was no reliable fallback, no universally trusted arbiter, and no stable shared framework through which corporate actions could be interpreted.

Into this vacuum, reputation emerged as the primary cross-stakeholder mechanism through which judgments could be consolidated to determine if legitimacy would be granted or withheld. It is not a communication strategy or a brand asset. It is the signal through which society evaluates whether corporate power is being wielded responsibly. Reputation became what every stakeholder watched, including employees, consumers, investors, regulators, activists, and the public, to determine whether an institution deserved permission to operate.

Reputation became the only mechanism left through which that power could be evaluated. But what reputation reveals, when it has no filter and no institutional mediator, is not just how decisions are made. It is what those decisions actually cost. The Reputation Era's structural condition created a peculiar vulnerability. Corporations operated at a scale where consequences could be neither fully anticipated nor fully hidden. Some societal harms emerged from complexity too vast to foresee, while others were foreseen and deliberately concealed. The distinction

DOWNLOAD THE BOOK PROPOSAL

between incidental and malicious harm matters to executives, but to stakeholders, that difference does not eliminate accountability. The gap between what institutions claimed they could understand and what they actually knew has helped shape the delegitimizing landscape that defines the modern era.

Passage 3: The Externality Reckoning

Summary Text (Not Included in Final Copy): As corporations scaled in power and precision, so too did the societal consequences of their decisions. Historically moments of harm were tolerated, obscured, or diffused in pursuit of economic growth and societal advances. A growing societal consciousness, driven by mass media, increased corporate visibility exposing the negative externalities corporations have on society. The result was a continued erosion of institutional trust, reshaping the basis on which legitimacy was granted. Visibility in the communication era translated to scandal through the Reputation Era, leading stakeholders to no longer assume good faith; they increasingly expected corporate foresight, mitigation, and accountability for the negative externalities they imparted upon society.

The consequences of corporate scale are no longer invisible or distant. What corporations do ripples across labor systems, communities, and ecosystems in ways that stakeholders can now observe, measure, and attribute in real time. This visibility has fundamentally shifted how society evaluates institutional power. Consequences

DOWNLOAD THE BOOK PROPOSAL

that were once diffuse, delayed, or difficult to trace are now immediate and measurable. They accumulate in public view, shaping perception before corporations can respond.

This natural rise in scrutiny dampens the prosperity shield that once protected corporate expansion. Recall that corporations earned legitimacy as long as stakeholders felt the benefits of growth and consequences remained invisible. But visibility changes the equation. As consequences become undeniable, stakeholders no longer assume that competence and scale equate to trustworthiness. The shield that once granted corporations permission to expand without question now requires constant defense.

Not all consequences, however, are the same. Some harms emerge from scale and complexity faster than understanding can follow. These are blind consequences, outcomes that could not have been fully anticipated at the moment of innovation or decision. Others are foreseen and deliberately managed in service of commercial outcomes. These are hidden consequences, harms that corporations knew about and chose to conceal or minimize. The distinction mattered once, when institutions mediated meaning and could differentiate between unlucky and unethical. This distinction, now, offers little protection in a world where institutional trust has fractured.

DOWNLOAD THE BOOK PROPOSAL

Both types of consequences undermine legitimacy, but for different reasons. Hidden consequences suggest a deliberate decision to prioritize commercial objectives despite known harm. Once brought to light, they often trigger crisis-inducing scandals because concealment is interpreted as evidence of compromised integrity.[32] Blind consequences are different; they reveal structural negligence, not a calculated plot. Yet in an environment saturated with institutional skepticism, the distinction between the two becomes almost academic. Society has accumulated so many documented cases of hidden harm, so many scandals where companies knew and acted anyway, that the default assumption has shifted. Stakeholders now generally assume consequences are known and ignored, choosing to scale anyway. Skepticism leads to the notion that concealment is the rule, not the exception. Even an unforeseeable harm translates to negligence and accountability failure. And when a single "honest" misstep happens, as they usually do, it triggers stakeholder suspicion that all harm is deliberate and malicious.

The tobacco industry provides a historical case of hidden consequences deliberately managed for profit. Internal documents later revealed that major tobacco companies possessed extensive scientific evidence linking smoking to cancer and addiction by the

DOWNLOAD THE BOOK PROPOSAL

1950s.[33] Rather than acting to mitigate harm, corporate strategy focused on suppressing research, manufacturing doubt, and prolonging regulatory inaction through coordinated campaigns.[34] Product design and marketing were optimized not merely to sell cigarettes, but to sustain addiction and recruit new users, including younger populations. When called to testify before Congress in 1994, tobacco executives claimed the evidence was inconclusive, their products were not addictive, and they were not marketing to children. Internal documents later made public told a starkly different story.[35]

The opioid crisis followed a similar pattern. Beginning in the late 1990s, pharmaceutical companies aggressively marketed prescription opioids as safe and effective treatments for chronic pain, often minimizing the risks of addiction and dependency.[36] Internal communications revealed these firms knew of the addictive potential long before public harm became visible.[37] Yet corporate strategy prioritized

rapid market expansion and revenue growth. Sales representatives were incentivized to encourage broader prescribing. Educational materials emphasized low addiction risk and positioned opioids as compassionate care. Between 2013 and 2015, one in twelve American physicians received opioid-related marketing. Among family physicians, it was one in five.[38] As prescription volumes surged, addiction rates, overdose deaths, and community destabilization followed.[39] In both cases, corporate power was exercised with precision in pursuit of growth, while costs and consequences were externalized to society.

But not all negative externalities are deliberately hidden. Microplastics offer a counter example of blind consequences. Plastic became a transformative innovation in the twentieth century. It solved genuine problems that created societal prosperity, because it was cheap, durable, and versatile. Corporations seized the prosperity shield, optimizing production and distribution at scale. No company set out with a plot to contaminate. No executive intentionally designed microplastics to pervade human bloodstreams, accumulate in organs, and possibly alter cellular function.[40] The harm

DOWNLOAD THE BOOK PROPOSAL

was not foreseeable at the moment of innovation. This consequence emerged from scale itself. Over decades of production, plastic decomposed into particles invisible to the naked eye. Those particles entered waterways, food chains, and human bodies. Later, as measurement technology improved and research accumulated, the full scope of harm became visible. By then, microplastics were everywhere.[41]

But microplastics are no longer a blind consequence, it is now a chronic one. Once visibility emerged, the industry response was slow, fragmented, and insufficient to match the scale of harm that had already accumulated, while production continued to expand and meaningful accountability remained elusive. The harm did not resolve into reform, it embedded itself further into ecosystems and human bodies as corporations defaulted toward incremental improvements rather than fundamental transformation. This is precisely why stakeholders perceive little difference between blind and hidden consequences, because when a blind consequence becomes visible and corporations fail to act with integrity, the original ignorance ceases to matter and the response begins to feel indistinguishable from concealment. What stakeholders evaluate is not the moment of discovery but the pattern of action that follows it, and

DOWNLOAD THE BOOK PROPOSAL

when that pattern resembles persistence rather than accountability, the distinction between unforeseeable harm and deliberate harm collapses entirely.

These three negative externalities underscore a defining lesson that shaped the Reputation Era. Some harms are concealed deliberately. Others emerge from scale and complexity faster than understanding can follow. In both scenarios, corporations operated with competence and precision in pursuit of their designed purpose. They optimized markets and they solved problems to deliver prosperity. Yet the consequence-awareness required to foresee and manage ripple effects was simply not fully built into corporate decision making architecture. When stakeholders began seeing the full chain from corporate decision to societal consequence, with a perceived lack of accountability, trust could not recover. Corporations in the modern era are perceived as lacking the mechanisms required to reliably manage the consequences that their accelerated scale created.

This erosion weakened the legitimacy of the corporate archetype itself. A public that once assumed competence meant trustworthiness now assumes the opposite. Stakeholders expect proof of consequence-awareness, not just capability. They interpret silence not as confident self-governance, but as potential concealment. In this environment, even well-intentioned organizations operate under presumption of scrutiny. Legitimacy, in the Reputation Era, must be actively earned rather than

DOWNLOAD THE BOOK PROPOSAL

passively assumed. Now a single misstep can send reputation plummeting, which is a reputational inheritance of the modern era. Corporations traverse a landscape shaped not only by what they do, but by the accumulated memory of what other corporations failed to do, which is to anticipate potential societal consequences, accept accountability, and act with integrity.

Passage 4: The Growth-Responsibility Paradox

Summary Text (Not Included in Final Copy): As corporations expand, their influence over economies, governments, and social systems intensifies, making them not just business entities but key societal players. With this power comes heightened scrutiny, as the public, regulators, and stakeholders demand greater ethical responsibility, transparency, and accountability. The larger a corporation becomes, the more it must answer for its impact on workers, consumers, communities, and the planet.

This memory has translated into an increasing surge of populist skepticism toward institutions.[42] But this movement misunderstands that the ascension of modern corporate power followed no master plan. It was not the outcome of a grand design engineered in boardrooms by executives with master plans. Instead, corporations ascended to their current scale through a series of historical events, market dynamics, economic conditions, and incentive systems that emerged precisely because societies

DOWNLOAD THE BOOK PROPOSAL

demanded them. The memory of consequences and perceptions of significant corporate scale easily lends to the conclusion that corporations have been seizing power, despite a historical account which shows that they inherited it. Gradually, over time, it was granted piece by piece from public and governing bodies that wanted prosperity in the forms of faster innovation, better infrastructure, cheaper goods, convenience, and economic resilience. What they did not anticipate was that granting a private institution such capacities would eventually transform that institution into something that demanded a new, much more complex, system of accountability.

The core tension of modern corporate power lies in a paradox that cannot be resolved within current corporate architecture. Corporations were built to scale, optimize, and deliver prosperity at speed. They were not built to foresee and manage the full spectrum of consequences their decisions create across labor systems, communities, and ecosystems.[43] Yet that is now what society demands. Corporations are simultaneously expected to grow and, at the same time, to master the consequences of growth. They are expected to innovate and to anticipate all ripple effects of innovation. They are expected to move fast and to absorb the full weight of what speed creates. These mandates are not only paradoxical, they are incompatible. No system designed to maximize efficiency and returns can simultaneously manage all

[43] Idowu, S. O. (Ed.). (2013). *Encyclopedia of corporate social responsibility*. Springer.

DOWNLOAD THE BOOK PROPOSAL

consequences with equal rigor. This paradox is one of structure, not a matter of bad actors within political circles or executive leadership teams. It is a structural dilemma embedded in how corporations are fundamentally organized.

This paradox manifests concretely in the expanding criteria stakeholders use to evaluate companies. Those criteria now extend far beyond marketing performance and economic impact to include how corporate operations shape the systems on which society depends.[44] Employees evaluate conditions of fairness, safety, and dignity alongside compensation and opportunity.[45] Consumers increasingly examine sourcing, labor practices, and environmental impact in parallel with product quality.[46] Communities assess whether corporate presence contributes to local resilience or extracts value without reinvestment.[47] Regulators and policymakers consider whether scale is being used to advance innovation responsibly or leverage corporate velocity to concentrate marketplace advantages, exploit regulatory grey space, or skirt

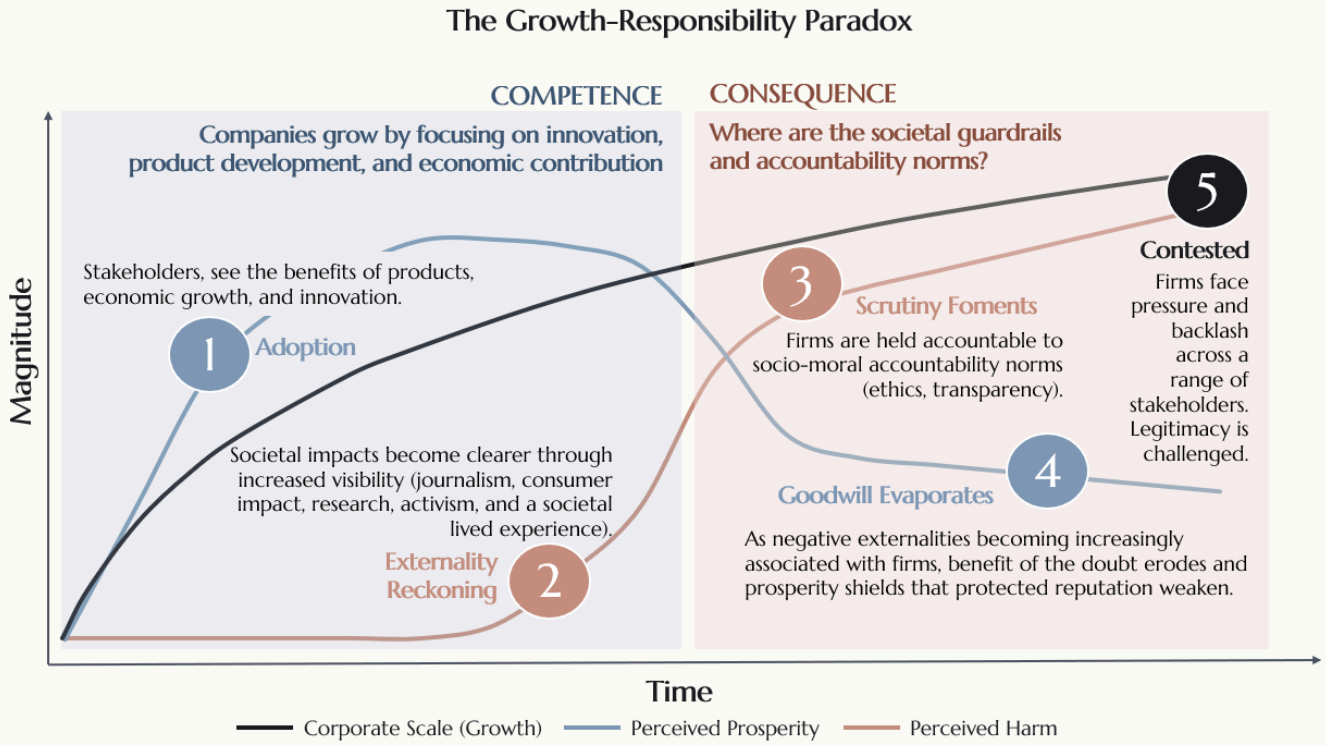
DOWNLOAD THE BOOK PROPOSAL

compliance and oversight.[48] This widening lens marks a structural change in how legitimacy is earned, requiring an alignment between capability and consequence. As corporate influence expands, so does the expectation that institutions anticipate the effects of their decisions beyond immediate financial outcomes to deeper societal impact. The paradox is not theoretical. It is the daily reality that corporations now navigate.



Within this paradox, reputation emerges as the primary currency through which stakeholder judgments are consolidated and legitimacy is strengthened, contested, or

[48] Crandall, R. W., & Hazlett, T. W. (2023). Antitrust reform in the digital era: A skeptical perspective. *The University of Chicago Business Law Review*, 2(2), 293–331. https://chicagounbound.uchicago.edu/ucblr/vol2/iss2/1/

DOWNLOAD THE BOOK PROPOSAL

weakened. But reputation is not a solution to the paradox. It is a diagnostic that reveals gaps between what corporations can foresee and what they actually cause. It makes visible the structural misalignment between corporate capability and corporate consequence. And because that gap is structurally designed to create consequence from competence, reputation becomes a currency that is in chronic short supply. Put simply, stakeholders demand proof of consequence-awareness that the current operating model of corporations cannot reliably provide. Legitimacy in the Reputation Era therefore depends on forms of accountability that many institutions are still struggling to build. The paradox remains unresolved, leaving reputation as the social judgment through which these systemic failures become visible and consequential. Ironically, there was a brief moment in history when visibility appeared capable of enabling accountability. Information would spark an externality reckoning, and stakeholders that could see consequences would demand safeguards. there was a brief moment in history when visibility appeared capable of enabling accountability.

Chapter 2: Reputation Hanging in the Balance

Quote Text (Placed on the section break page): *"If a problem cannot be solved, enlarge it." — Dwight D. Eisenhower*

Passage 5: Pulling the Curtain Back

Summary Text (Not Included in Final Copy): Journalism evolved from a democratic watchdog into a fragmented and decentralized information ecosystem shaped by market incentives and technological acceleration. Along the way, narrative authority consolidated, fractured, and ultimately destabilized, giving rise to misinformation, perceived censorship, and erosion of shared reality. What began as scrutiny of corporate power became a system in which narrative itself became a source of asymmetry.

Rapid global scale, velocity gaps, and widening societal negative externalities played a significant role in producing the Reputation Era. But to truly understand how this era fell into place, the dynamics of corporate power must be explored. The power transformations that formed the Reputation Era, came about recently, spanning over the past 150 years. In this timeline corporate power would become highly visible, then unstable, then contestable.

Corporate power, that most closely resembles the power structures of modern day corporations, had accumulated significantly in the industrial age. Leading up to this point this power transformation was mostly quiet, obscure, or not fully understood. At this time prosperity looked like railroads that stretched across continents, oil pipelines that move energy across regions, and steel plants that were reshaping city skylines.

DOWNLOAD THE BOOK PROPOSAL

Leading into the early 1900's the mechanics of corporate scale were complex, distant, and difficult for most citizens to see. The New Dawn Era would translate that complexity into visible corporate power. In doing so, it would begin to destabilize a reputation operating system that had previously been relatively simple. Reputation was easier to sustain because corporations could earn legitimacy as long as a narrow group of political and public elites interpreted increasing corporate scale as evidence of competence and prosperity. A company's durable permission to operate therefore rested on a largely linear assumption, as long as capable institutions produced prosperity, then prosperity would provide sufficient grounds for legitimacy. This was the reputation operating system that had guided corporate behavior up to this point in history.

This software had a critical vulnerability, one that would glitch when the consequence of prosperity, as a result of accelerating scale, became visible. But for stakeholders to "see" the consequences of industry, they would need an interpreter that could decode corporate influence. The visibility of corporate power did not arrive through a single invention or political event. It emerged through the gradual construction of an information architecture that made hidden systems visible, and in doing so, the reputation operating system would begin to glitch.

DOWNLOAD THE BOOK PROPOSAL

The stakes of the Reputation Era are not defined by corporate speed alone, but also by the systems that interpret and amplify that speed. Reputation exists in many locations, but it primarily resides in an information environment. In the New Dawn Era that information environment would evolve dramatically, alongside the institutions in it.[49] When industrial corporations began to accelerate scale across jurisdictions and communities, the public could not immediately grasp what that scale, and its potential consequence, meant. Negative externalities were experienced as slow moving, disparate, seemingly disconnected events such as rising prices, disappearing competitors, and shifting labor conditions. Those isolated stories did not always resonate with stakeholders because they lacked narrative coherence.

Journalism, especially muckraking journalism, provided that coherence. It translated dispersed negative externalities and corporate power into visible consequences. While journalism can be traced back to the Roman Era[50], its transformation into a professional, ethically oriented discipline marked a structural reputation turning point. The New Dawn era would formalize the journalism industry, including the founding of the University of Missouri's journalism school in 1908[51]. This journalism industry would

make it possible for society to examine the mechanics of scale itself, including not just its outcomes. This anchored a broad societal expectation that concentrated power will be watched.[52]

Ida Tarbell's investigation into Standard Oil represents one of the clearest expressions of this shift. Beginning in 1902, her serialized reporting reconstructed the internal mechanics of Rockefeller's empire, detailing railroad rebates, secret agreements, and consolidation tactics with a level of clarity that made corporate power comprehensible to a broader public.[53] Tarbell's work was not merely investigative; it was a translation of power that widened visibility. The distance and obscurity of what Rockefeller was as a figure in society transformed into public narrative. Business leaders became legible societal actors that could now be examined and judged. Once stakeholders could see beyond corporate prosperity, the basis on which legitimacy was granted began to change. The equation to determine permission to operate became a net sum of prosperity minus perceived consequence. The reputation operating system was increasingly becoming a multi-variate equation.

Scrutiny of influential corporate power led to the passage of the Sherman Antitrust Act. A landmark law designed to prevent monopolies and restrain concentrations of economic power that could distort markets and harm the public. It became the defining intervention against Standard Oil, signaling that corporate scale, once celebrated, had crossed into a domain requiring formal oversight. But legal action did not serve as the key reputational transformation. Public opinion did not shift because of a legal ruling, it shifted because corporate power was emerging from behind the curtain.[54] The early twentieth century was more than an antitrust enforcement, it was the new dawn of corporate scrutiny.

As visibility expanded and took hold, scrutiny reinforced the relationship between visibility and accountability. Newspapers, often locally rooted, positioned themselves as civic institutions tasked with informing the public and exposing power.[55] The institution of journalism derived its own legitimacy by serving as an interpreter for power and influence. Stories that revealed corporate vulnerability reinforced the credibility and authority of the press. In exposing the consequences of corporate scale, journalism simultaneously strengthened its own legitimacy. The rise of

journalism served as a counterweight to corporate power, widening the number of stakeholders whose judgments institutions had to navigate.

Over time, visibility continued to widen, further pulling back the curtain, revealing societal consequences of corporate power not fully understood before. Issues such as labor practices, once confined to local contexts, could now become the subject of national interpretation. The Ludlow Massacre of 1914 illustrates how visibility could transform a localized industrial dispute into a nationwide legitimacy crisis.[56] When striking miners and their families were attacked by the Colorado National Guard, amid allegations of influence from Rockefeller interests, at least twenty people were killed, including women and children.[57] Public outrage spread rapidly through national coverage. Rockefeller, with a reputation already tarnished by issues of vast industrial scale, now became associated with human dignity as a cost of conducting business. Journalism collapsed the distance between action and perception, translating a localized tragedy into a delegitimizing national narrative.

The reputation operating system was expanding to include a wider range of stakeholders. Corporations could no longer rely solely on the acceptance of political

and economic elites; they also had to navigate media scrutiny and the increasingly visible experiences of employees and communities. Enter Ivy Lee, who advised Rockefeller to engage directly with journalists. By releasing information proactively, he sought to humanize corporate leadership and provide an explanation of corporate conduct.[58] His approach reflected a recognition that visibility had fundamentally altered the changing environment businesses were operating in. Corporations had become visible, and with that visibility silence would undermine legitimacy. Consequently, visibility requires communication, or, in its absence, interpretation will fill the void.[59] It was a transformative moment, it was understood that silent competence alone could not resolve multi-stakeholder scrutiny. Public relations emerged as an evolutionary adaptation to this more complex, multistakeholder reputation system. It was not initially conceived solely as persuasion, though that remit would expand over time. Its earliest role was to help institutions respond to visibility, explain their conduct, and navigate the widening set of judgments affecting their legitimacy.

Within decades, the communications function became an instrumental component of supporting institutional legitimacy. In an ironic twist, a practice initially developed to

protect businesses from the reputational consequences of scale was soon used to accelerate scale itself. Edward Bernays extended the logic of public relations beyond response into influence. Drawing on psychological theory, he argued that public opinion could be shaped through deliberate communication strategies.[60] His campaigns demonstrated that narrative could do more than explain corporate behavior. It could shape how that behavior was perceived, and even create demand where none previously existed. The emotional mechanisms that Bernays would deploy in communications campaigns would later threaten an information ecosystem that consolidated and aligned through the mid-twentieth century. These threats to information stability would come to define the closing moments of the Unbounded Era (late 1900's).

Before the information ecosystem would fracture, there was a long duration of stability in the news ecosystem. For most of the mid-twentieth century the media network was highly consolidated. Advances in radio and television created a nationalized information environment in which a small number of institutions mediated public understanding.[61] Walter Lippmann, a Pulitzer prize winning American journalist, observed a complex, increasingly global, news environment that needed to

be centralized. He believed that people relied on "pictures in our heads" to interpret increasingly dynamic world realities that had become proportionally overwhelming with the scale of news information.[62] At this time broadcast networks such as NBC, ABC, and CBS dominated the information landscape, these three outlets aligned and shaped how events (pictures in heads) were interpreted across the country.[63] Figures such as Walter Cronkite became trusted reference points, capable of influencing public sentiment and political decision-making simultaneously.[64] This environment created stability through a shared reality.

For corporations, this structure offered stability. Reputation could be managed within a structured, periodic narrative system. A crisis would unfold over extended intervals, typical in daily news cycles. Interpretation was mostly uniform and could be mediated through a finite set of channels. Corporations evolved their ability to anticipate, respond, and stabilize their narrative as scale continued to accelerate. As a result this period of time is often remembered as one of high institutional trust. That trust was a function of something more than just institutional behavior, it was a function of narrative alignment. Visibility existed within an information system capable of

translating events into relatively coherent shared interpretations. As long as that relationship held, legitimacy could be contested without it becoming unstable.

While a shared narrative held, for the time being, a new structural tension began to expose itself. One where visibility revealed how corporate innovation operated at a different velocity than democratic governance. Markets moved quickly, driven by incentives to innovate, scale, and capture advantage. Meanwhile, governance moved slowly, designed to deliberate, democratize, and reconcile competing interests to produce durable balanced rules.[65] This velocity gap became legible as journalism did not simply expose corporate behavior, it revealed how long that behavior could persist before meaningful government oversight emerged. The distance between scale and governance became visible. That widening gap would later become another defining feature of the Reputation Era.

One reason this governance gap widened was because companies learned how to effectively navigate "labels". Classification became a key strategy, "we are a platform, not a publisher," "we are a marketplace, not a financial institution," a strategy that was effective for navigating regulatory ambiguity.[66] Another factor driving the governance gap was the mobility of capital, rewarding speed and market capture over alignment

with governance structures. Corporations also recognized that increased consumer prosperity and delight only further delayed scrutiny, as early-stage innovations delivered superior convenience and quality.[67] Consumers would become habituated with improved experiences before consequence could become widely visible. A sometimes intentional strategy to acquire market share through an exceptional consumer experience before the negative externalities were understood. These strategies proved successful in expanding scale before governance could catch up, at this point companies could become entrenched before scrutiny could set in.

While scrutiny was delayed by increased prosperity, over time the consequences would become largely interpreted and understood. Now stakeholders evaluated not only whether companies complied with existing rules, but whether they recognized emerging risks and acted responsibly in the face of visible consequences.[68] This is where reputation diverges from legal conformity. Institutions could be legally compliant, but failure to mitigate externalities once they were aware of them would still leave legitimacy contested. What emerged was a reputational fault line where successfully scaling a company also introduced scrutiny. The question was no longer

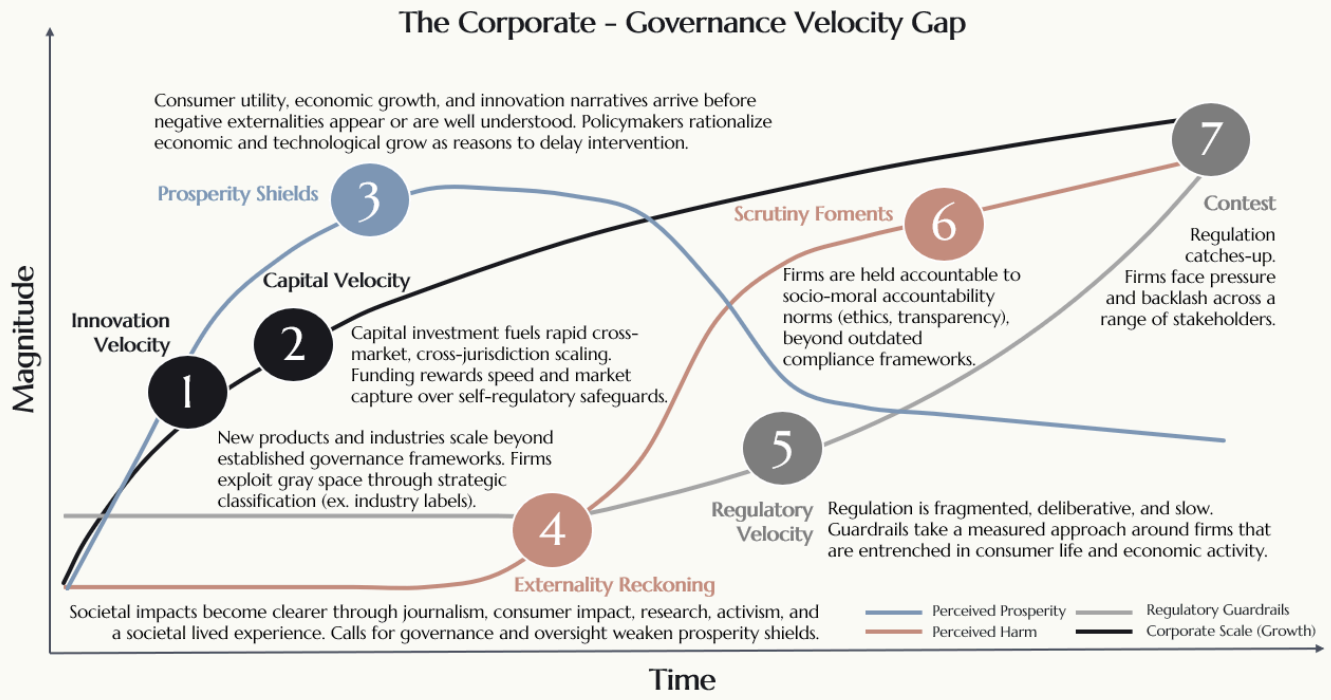
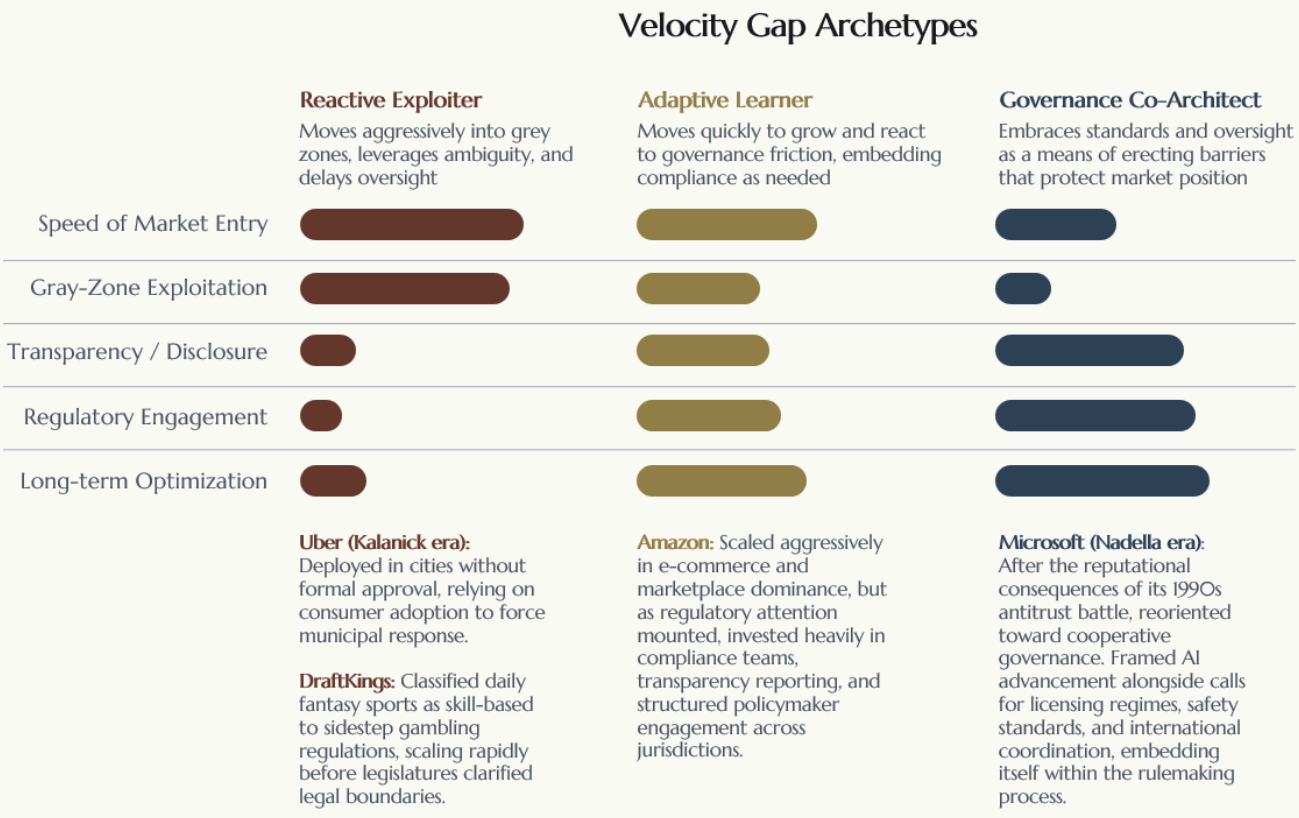
simply whether a company could scale within the rules. It was whether it was perceived to act responsibly within a system where the rules themselves lagged behind visible consequence.



Corporate responses to velocity gaps varied. Some organizations intentionally prioritized speed, exploiting regulatory ambiguity to capture market share before oversight could catch up. Others adapted, gradually investing in compliance as risks became visible. While some other companies take a completely different approach, recognizing that the velocity gap could be used to their advantage. In this case, they

DOWNLOAD THE BOOK PROPOSAL

could deploy proactive legal compliance that could be used to shape governance itself, participating in the design of rules that would govern their industries and erect barriers to faster moving entrants. None of these approaches are primarily driven through ethical design, they are strategic responses to the same structural condition where innovation and capital velocity moves faster than governance and visibility. The velocity gap ultimately leads to three unique business strategies. Firms could choose to position themselves as either a Reactive Exploiter, an Adaptive Learner, or Governance Co-Architect.



Visibility and velocity gaps alone did not produce the Reputation Era. It was, however,

DOWNLOAD THE BOOK PROPOSAL

a prerequisite and a marker of the New Dawn Era (Early 1900's). A time period where the reputation operating system would reveal itself as glitched and vulnerable. Power and asymmetry had become legible. But legibility alone did not fully destabilize the system. As corporations entered the Enbounded Era (~1950's), they faced a wave of instability, not from crisis, but through systematic structural design. This is the transition point that would crash the reputation operating system. Institutional power would not be contested because the curtain was pulled back, it would be challenged because common ground collapsed and a shared reality was lost.

Passage 6: The Collapse of Common Ground

Summary Text (Not Included in Final Copy): Two converging shifts, the redesign of capitalist incentives and the fragmentation of information systems, introduced significant power instability, weakening the structures that once anchored institutional legitimacy. As financial incentives pushed corporations toward short-term value and global capital mobility expanded asymmetry, institutions grew more distant from consequences, exposing a gap where legal compliance no longer guaranteed public trust.

Power had become visible, but something much deeper was about to change. Two converging forces, one economic and one informational, would set the stage for the modern day Reputation Era. On one side, the architecture of capitalism itself would

be redesigned. Capital became more mobile, incentives were realigned around equity performance, and the structural ground beneath the post-war settlement shifted in ways that altered who benefited, how visibly, and at what cost to whom. On the other side, the information systems that translated corporate conduct narratives were fragmenting, accelerating, and polarizing. The shared narrative that allowed society to process institutional behavior through common reference points dissolved. While multiple factors produced the Reputation Era, the most formative influences were the ones that created power instability. As time progressed, shared realities further disintegrated while asymmetry expanded exponentially and, as a result, competence, on its own, became increasingly less effective for sustaining legitimacy.

Power instability begins at the heart of the Unbounded Era, in the 1970s. A time marked by turbulence and crisis for the American economy. The country faced destabilization from global competition, shocked by simultaneous stagnation and rising energy prices.[69] Instability, at this time, would not be resolved. It would be reshaped, redirected, expanded, and delayed. These pressures led to an intellectual reframing of capitalism. On a Sunday morning, September 13, 1970, *The New York Times Magazine* published an essay titled "The Social Responsibility of Business Is to Increase Its Profits," written by the American economist Milton Friedman. The

argument was direct, asserting that corporate executives are employees of shareholders and therefore have a fiduciary duty to maximize the value of investors and other capital intensive stakeholders. A company's main fiduciary duty, in this context, conveyed an obligation onto directors and executive officers to act in the best interests of shareholders. This also encompassed the duty of care, meaning management would be required to make informed and prudent decisions, avoiding any conflict of interest that would compromise, and reduce, shareholder returns. So long as a company ensured the language and labels they used to describe business operations were "within the rules of the game," they would remain in legal compliance and within basic ethical expectations.[70] This framework treated compliance with formal rules as sufficient evidence of responsible corporate conduct. As long as a company operated within legal and regulatory boundaries, it could reasonably expect that its legitimacy would remain intact. The Reputation Era would reveal the limits of that assumption. Institutions could comply with the rules governing their conduct while still falling short of evolving stakeholder expectations concerning fairness, consequence-awareness, accountability, and integrity.

Contrary to the popular notion, Friedman's essay did not instantly transform corporate behavior. While the argument helped articulate a direction toward

shareholder primacy, providing intellectual clarity at a time when American industry was searching for stability, the proposal required a more structural path to executing the vision. It took nearly a decade for a formal doctrine to become fully operationalized within corporate governance. The mechanism for translating Friedman's vision was through purposefully reengineering corporate incentive design. One of the most influential figures in that transformation was the economist Michael Jensen. In his landmark 1976 paper, "Theory of the Firm," co-authored with William Meckling, Jensen articulated what became known as agency theory. The argument was straightforward, corporate managers are agents of shareholders, and misalignment between managerial incentives and shareholder interests is inefficient. The solution, Jensen argued, was to redesign how executives are incentivized, ensuring that they are compensated in ways that tie their wealth directly to shareholder returns.[71]

This logic moved from academic journals to boardrooms. Compensation structures shifted, with executive pay increasingly anchored to equity awards and stock options.[72] In practical terms, this meant that leadership decisions increasingly aligned with stock performance. The shift would prove to be consequential because it

DOWNLOAD THE BOOK PROPOSAL

recalibrated what corporate leadership optimized for. Corporate leadership lost their ability to transact a long-term vision that created durable business resilience. Instead it was incentivized to maximize market value, with an increased focus on driving consistent and continual short-term wins for its shareholders. The focus moved to devising tools that would expand market value dramatically. Scale became a key success factor and with it scrutiny would be sure to follow.

As Jensen's intellectual framework renovated corporate boardrooms, the need to retrofit the financial system plumbing with it became evident. In 1982, the Securities and Exchange Commission adopted Rule 10b-18, providing companies with a "safe harbor" when repurchasing their own shares.[73] While stock buybacks were not new, the rule clarified how and when firms could buy back their own stock without facing accusations of market manipulation. Buying a company's own stock was a simple but powerful tool for driving shareholder value. Buybacks reduced the number of available stock shares, which boosted a company's earnings per share evaluation. This in turn, would lead to stock price appreciation. When executive compensation was tied to stock price, it reinforced executive financial decision making that would elevate shareholder returns. As a result, the flow of profits that might have been directed toward business reinvestment (ex. wage growth, infrastructure investments,

product innovation, etc.) previously was now being redirected towards increasing and protecting investors.

As the incentives systems changed corporations innovated additional tools to drive market share. From this, buybacks would be only one of several financially engineered solutions. Leveraged buyouts emerged as another powerful capital restructuring tool during this same time period. A leveraged buyout, known as an LBO, involves acquiring a company using a significant amount of borrowed money, with the acquired company's assets often serving as collateral for the debt that was used to purchase it.[74] If a company was seen as inefficient, bloated, or underperforming relative to its asset base, it became a target. The acquired, underperforming, firm would have inefficiencies eliminated, costs reduced, assets rationalized, operations streamlined, and performance improved.[75]

Firms such as Kohlberg Kravis Roberts, led by private equity financier Henry Kravis, became emblematic of this leveraged restructuring model.[76] His 1988 buyout of RJR Nabisco became more than a transaction. At roughly $25 billion, it was the largest

leveraged buyout in history at the time. The bidding war between corporate management and private equity firms unfolded visibility, transforming what might have been a technical financial maneuver into a phenomenon that struck awe and spectacle.[77] Chronicled in the book *Barbarians at the Gate*, the deal revealed to society that corporate power was shifting from managerial stewardship into aggressive allocation within capital markets. For many observers, it translated to a cultural moment when financial engineering became synonymous with highly influential transformative corporate power.

To drive shareholder value, the tools of financial engineering continued to stack and layer upon each other. Fueling many of these LBO transactions was the rise of the high-yield, or "junk," bond market. Michael Milken, working at Drexel Burnham Lambert, pioneered the large-scale underwriting and distribution of lower-rated, higher risk, corporate debt.[78] Milken argued that many firms with weaker credit profiles were undervalued rather than inherently risky. From this he built a market that channeled vast sums of higher risk capital, which are fittingly called junk bonds, into new financially engineered tools. These junk bonds financed leveraged buyouts at unprecedented scale. With the supply of debt becoming increasingly available, the

result was a surge in corporate takeover activity that normalized the culture of taking on exceedingly higher levels of risk.[79] While the 1980s LBO wave did not directly cause the mortgage crisis of 2008, it did create a culture of risk tolerance. Cracks were not obvious, because prosperity was expanding through market stabilization and rising economic activity.

Compounding this problem is another challenge that when a system is perceived to deliver prosperity, it is almost certainly expected to expand exponentially. This is precisely what happened to the financial incentive system, it expanded globally. As capital became more fluid within American markets, it also proved to be highly valuable as it expanded across borders. Roots of capital mobility now stretched from Wall Street to Shenzhen and Shanghai China, which was also shocked by another story of economic instability during the 1970s. At this time China was emerging from the economic and social upheaval of the Cultural Revolution. Industrial productivity lagged, state-owned enterprises were inefficient, and per capita income remained low.[80] China, like the United States, faced stagnation and structural fragility.[81] Deng Xiaoping's reforms were not ideological indulgences. They were pragmatic

interventions designed to stabilize and modernize a struggling economy. Deng captured his philosophy in a now-famous phrase: "It doesn't matter whether a cat is black or white, as long as it catches mice."[82] The message was clear, economic results mattered more than Communist orthodoxy. Beginning in 1978, China opened itself to foreign investment, establishing Special Economic Zones, and gradually liberalizing portions of its economy. This provided labor costs that were dramatically lower than in the American Midwest. For multinational corporations, the equation was difficult to ignore. Capital could now flow into new markets where wages were much lower, regulatory frameworks were underdeveloped, and scale could be achieved at extraordinary speed. Within the incentive system, the result was predictable, production capacity would expand rapidly through global supply chains.[83]

For capital mobility to accelerate fully, the policy infrastructure of global trade had to be formalized. The North American Free Trade Agreement, enacted in 1994, reduced tariffs and trade barriers between the United States, Canada, and Mexico, expanding cross-border supply chains and manufacturing integration across North America.[84]

China's accession to the World Trade Organization in 2001, along with broader globalization policies, further expanded cross-border mobility of goods, capital, and production.[85] As a result supply chains quickly fragmented and stretched across continents. Corporations could quickly shift capital globally, however, labor could not move with the jobs, they remained geographically fixed.[86] From this another velocity gap emerges. The velocity of capital began to outpace the velocity at which local communities could adapt. The balance between the two deepened creating an uneven ground where corporate executives held leverage that employees could not influence. The rules of the game were being followed, but this would not shield corporations from contest and scrutiny.

The framework established in *Exit, Voice, and Loyalty* by German economist Albert O. Hirschman is instructive here. A stakeholder that does not have options, is vulnerable in declining scenarios. Without an exit option, they must rely on their voice. In situations where the power to exit (closing factories) outmatches voice (employee advocacy), loyalty dissipates and reputation weakens.[87] By the turn of the Reputation

Era, that dynamic had become highly visible. Multinational corporations could reallocate production across continents while communities remained geographically fixed, financial institutions were rescued while households faced losses, and platform companies' global reach outpaced jurisdictional authority. The pattern was consistent. As exit continued to outpace voice, legitimacy strained. And where legitimacy strained, contestation followed.

That contest galvanized around perceived imbalance in the workforce. Productivity continued to rise through the late twentieth and early twenty-first centuries, but wages did not track as closely as they once had. Union density declined from its post-war highs of nearly one in three workers to just 5.9 percent in 2024.[88] Meanwhile, executive compensation, increasingly tied to equity performance, grew 1,094 percent from 1978 to 2024, while typical worker compensation increased by just 26 percent.[89] Wage growth remained more incremental and closely tied to local labor conditions, creating a widening asymmetry between the economic experience of corporate leadership and that of the communities around them. For a time, this divergence remained largely obscured, embedded within complex and abstract financial systems and softened by surface signals of stability and shared prosperity. The

economic system was shifting gradually, its imbalances had accumulated over decades, most of which was largely out of view.

The information environment followed a very different trajectory. It did not evolve slowly, nor did it conceal complexity in the same way. As new forms of media and communication reshaped how corporate behavior was interpreted and understood, the information system that corporations had learned to navigate began to erode. Visibility continued to widen, but the centralized narrative fragmented. Interpretation became continuous, moving toward real-time engagement. The strain on the information system was driven by speed, but also by incentive. Unlike the slow half century drift of economic imbalance, the information system breakdown unfolded faster, in full public view, reshaping and fragmenting perception faster than institutions could adapt.

The breakdown began at a point in time where corporate power was highly visible, but also highly coordinated and managed. By the 1950's Edward Bernays had architected a system, the public relations function, where corporations could navigate scrutiny and maintain legitimacy. He extended the evolution of corporate communications through his own psychological theories, which were influenced by his uncle Sigmund Freud. Public opinion, he believed, was not something simply to

DOWNLOAD THE BOOK PROPOSAL

respond to, but something that could be guided.[90] In the 1920s and 1930s, he orchestrated campaigns that linked products to identity, culture, and aspiration. Most famously, through his "torches of freedom" campaign, he reframed women smoking as a symbol of liberation.[91] In his influential essay, "Engineer of Consent", Bernays framed public relations as a scientific and purposeful process for shaping public support for ideas, policies, and products. Trained practitioners, he argued, could use research, psychology, and media channels to deliberately influence public opinion and align it with corporate objectives.[92]

Bernays introduced contradiction and tension into the same architecture he helped create. He demonstrated that corporate narrative could not only protect reputation and support legitimacy, but also accelerate corporate scale. Public relations was no longer designed solely to help institutions navigate scrutiny. The same discipline used to explain corporate conduct could also shape markets and expand desire. Could public relations serve as a steward of institutional credibility while simultaneously amplifying corporate ambition to scale the business?

While public relations expanded its remit within corporations, journalism was also undergoing its own transformation in scale and authority. The Unbounded Era (mid 1900's) saw technological advances in radio and television that connected disparate communities and produced, for the first time, a genuinely nationalized narrative.[93] The emergence of these networks consolidated and aligned what had been a fragmented media ecosystem. The public's shared reality was strong because narrative authority was highly centralized, with three major news networks (ABC, NBC, and CBS) capturing over 90 percent of the U.S. audience.[94]

Evening news anchors became trusted cultural figures, their voices serving as common reference points across the country and, increasingly, the world. Walter Cronkite became one of the most trusted among them. In 1968, after traveling to Vietnam to report on the aftermath of the Tet Offensive, Cronkite broke from his customary neutrality and concluded on air that the war appeared destined for a stalemate. The impact was immediate and profound. President Lyndon B. Johnson reportedly told aides, "If I've lost Cronkite, I've lost Middle America," capturing the extent to which a single broadcast voice could influence national mood and political calculation.[95]

Journalism, in this era, did not merely report events. It mediated the "pictures in our heads" to create a shared reality. The significance of that shared reality for the reputation operating system cannot be overstated. When narrative authority was centralized, institutions could navigate the judgments affecting their legitimacy within a relatively coherent interpretive environment. A crisis could be contained, explained, and contextualized through a limited number of authoritative channels. That coherence gave the reputation operations system stability, but it would not last.

The first fractures appeared in the regulatory architecture of broadcasting itself. In the later stages of the Unbounded Era, TV cable network expansion introduced new, widening competition. The repeal of the Fairness Doctrine in 1987 marked a philosophical shift in regulatory approach. Rather than requiring broadcasters to present contrasting viewpoints through an "equal time" rule on controversial issues, regulators placed greater confidence in market competition to produce balanced narratives.[96] The reasoning, on the surface, seemed plausible. In a marketplace with more channels and more choices, the logic of regulatory mandated balance seemed unnecessary. The belief that market forces would ultimately create balance was incorrect, however. Media deregulation revealed that differentiated news narratives could become a highly competitive strategy. The repeal of the Fairness Doctrine

[96] Ruane, K. A. (n.d.). *Fairness Doctrine: History and Constitutional Issues*.

DOWNLOAD THE BOOK PROPOSAL

inadvertently laid the groundwork for a landscape in which partisan media thrived as broadcasters could tailor content to specific audiences.[97]

In this newly deregulated environment, executives such as Ted Turner and Rupert Murdoch recognized that format and identity could scale alongside content. CNN accelerated the news cycle with twenty-four-hour coverage, transforming news from a scheduled event into a continuous stream. Fox News leaned into audience alignment and opinion-driven programming, building a distinct editorial identity that attracted a loyal viewership. Many observers saw these developments as simple political positioning, but what they missed was an audience-targeting business strategy that aligned to new market incentives within an increasingly competitive journalism landscape. Leaders of media companies quickly understood that audience segmentation was powerful, and with it the scale of the media industry grew.[98] With that increased scale, the shared narrative center that once anchored broadcast journalism weakened. Different audiences consumed different interpretations of the same events, offered by different outlets with different editorial commitments. The

common ground that had allowed institutions to navigate the judgments affecting their legitimacy was eroding beneath them.

If cable fragmentation cracked the shared narrative, digital platforms shattered it. As news moved from print and broadcast into digital formats, the economics and architecture of journalism shifted fundamentally. Search engines redefined how information was discovered. Social platforms redefined how news was distributed. As distribution digitized, algorithms optimized for engagement. Emotional intensity often outperformed nuance, context, and verification. Content that provoked strong emotional reactions traveled farther and faster than traditional broadcast networks ever could.[99] What many interpreted as ideological bias was, at a structural level, the product of competing realities emerging as audiences consumed divergent interpretations of the same events.[100]

As an already weakened journalism industry confronted technologies that lowered barriers to entry, news consumption shifted rapidly toward social media feeds and video platforms. The influence of institutional journalism diminished as the media landscape became saturated with proliferating podcasts, independent newsletters, YouTubers, TikTokers, and influencer-driven commentary that increasingly served as

DOWNLOAD THE BOOK PROPOSAL

primary news sources.[101] Google reshaped search by organizing information around query and relevance rather than editorial hierarchy.[102] Facebook transformed distribution by moving news from destination websites into personalized feeds, where it competed for attention alongside friends, family, and entertainment. Twitter compressed news cycles into seconds, rewarding immediacy over reflection.[103] Digital content platforms leveraged a statute known as Section 230, which labeled them as neutral speech conduits rather than news publishers, and that classification mattered, because governance rules attach to labels.[104] This allowed technology companies to operate under different rules than traditional journalism companies.

Shifts in political communications proved to be equally consequential. In 2012, Barack Obama announced his reelection campaign via Twitter and YouTube, setting the stage for future campaign launches and major political announcements to increasingly occur first on social media, bypassing traditional news outlets.[105] Elon Musk also

supported the use of platforms to host political events, with the glitchy 2023 Florida Governor Ron DeSantis presidential campaign announcement on Twitter Spaces[106]. Credibility migrated from organizations to individuals and politicians around the world found they could increasingly bypass more critical traditional journalism in favor of friendly partisan media, personalities, and influencers who provided special access but rarely asked difficult questions.[107] This signaled a broader shift where political legitimacy and audience attention now reside. Content flowed toward amplification rather than interrogation, further accelerating the power of alternative media networks. If journalism had once served as the primary interpreter of institutional power, that interpretive authority was now dispersed across platforms, personalities, and algorithmic feeds that no single institution controlled.

For much of the past century, public relations and journalism had operated within a relatively coherent information environment that helped shape a shared reality. In recent decades, technological acceleration and deregulation fractured that coherence, creating a more unstable landscape in which institutional trust eroded more quickly than it could be rebuilt. It would be an overstatement to conclude that

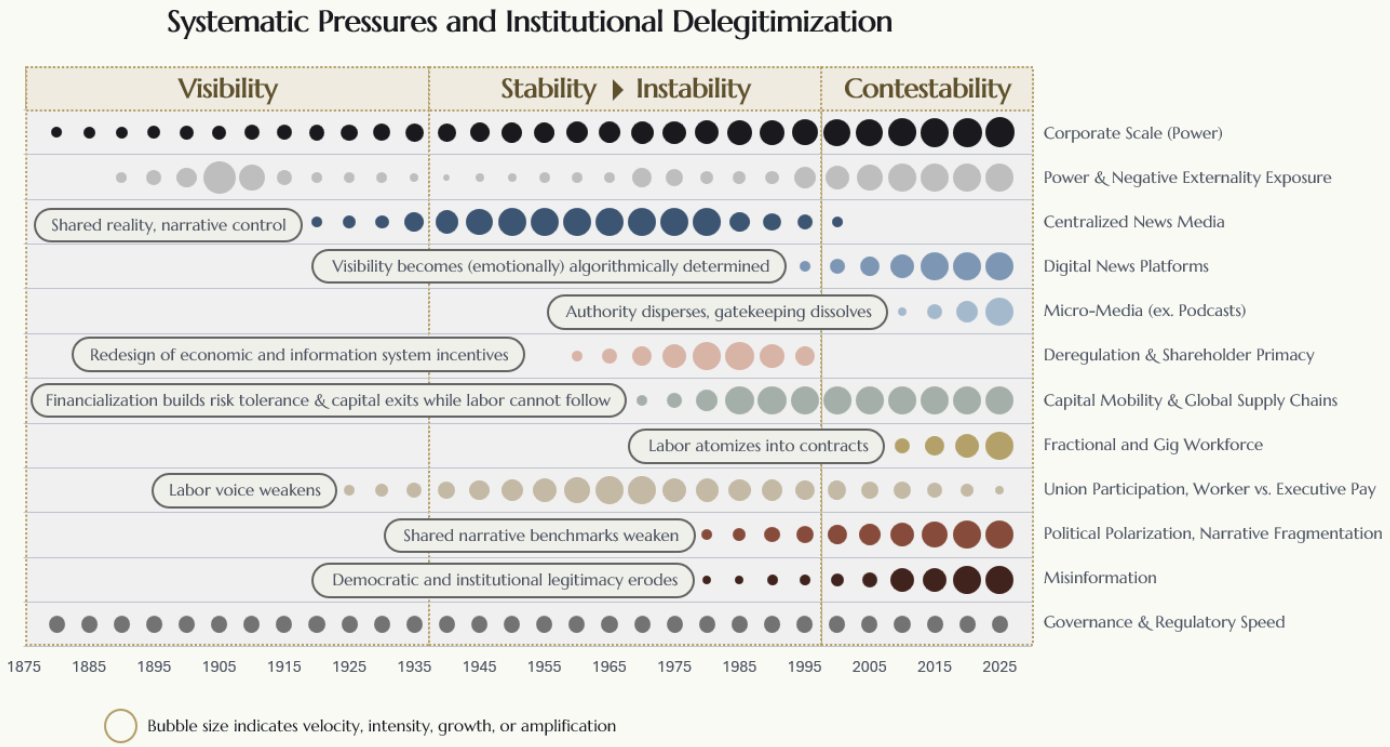
what changed was simply media technology. What changed was both market incentives and information system architecture. This shift moved reputation management from the margins of corporate operations toward the core of strategic endurance. It was no longer a downstream effect of business performance. It was becoming a condition for sustained operability. The structural progression of systematic pressures that created institutional delegitimization is in the visual.



Two forms of instability converged, setting the stage for the Reputation Era. The economic architecture of capitalism had been redesigned around shareholder primacy, capital mobility, and financial engineering, creating structural asymmetries

DOWNLOAD THE BOOK PROPOSAL

that deepened faster than accountability mechanisms could adapt. Simultaneously, the information architecture that interpreted corporate conduct had fragmented, accelerated, and polarized, dissolving the shared narrative benchmarks that once gave institutions a stable surface on which to manage perception.

The connection between these two currents is the key to understanding why the reputation operating system broke. The economic shifts created real consequences as communities were hollowed by capital mobility, wage trajectories diverged from executive wealth, and financial crises distributed risk downward. The information shifts ensured those consequences would be narrated, amplified, contested, and remembered in ways that a centralized communications function would struggle to navigate. Competence, which had once been sufficient to earn legitimacy, was no longer enough because the systems that mediated interpretation and stabilized the judgments supporting legitimacy were themselves fracturing. A company could accumulate operational excellence and still remain vulnerable to a reputational crisis, not because of scandal or failure, but because the ground on which reputation was formed had become permanently unstable.

Passage 7: Dialing Up the Pressure

Summary Text (Not Included in Final Copy): Corporate power in the Reputation Era became not just visible or unstable, but actively contested, as economic redesign and

DOWNLOAD THE BOOK PROPOSAL

fragmented information systems exposed institutions to continuous, multi-directional scrutiny. As more stakeholders gained the ability to challenge corporate conduct and trust declined across society, legitimacy shifted from something cognitively assumed to something constantly tested, where even compliant or well-intended actions could trigger skepticism, backlash, or reinterpretation.

With corporate power in the Reputation Era highly visible and increasingly unstable, the next development was its active contestation. The same technologies that fractured the shared narrative also armed the forces of contestation. A factory worker with a smartphone could document unsafe conditions and have the footage circulating on social media within hours. An investigative journalist with access to satellite imagery could track deforestation or emissions in near real-time. An activist investor could coordinate a shareholder campaign across jurisdictions through encrypted messaging. A whistleblower could reach millions through a single post on a platform that did not exist a decade earlier. Barriers to challenging institutional legitimacy shrank. Stakeholders were no longer distant, unorganized, or unheard.

This led to wide reaching systemic delegitimization that extended well beyond corporations. Trust fractures appeared across societal institutions as well, such as government, media, science, religion, and finance. Broad institutional distrust further compounded the pressure by weakening the credibility institutions could draw upon

DOWNLOAD THE BOOK PROPOSAL

when explaining their conduct. The result was a reputation landscape populated by increasingly skeptical audiences that were more difficult to persuade or reassure. Each of these dynamics reinforced the others. Together, they produced a reputational condition, not an episode, in which legitimacy would be continuously contested.

This skepticism was amplified by another condition of the Reputation Era. Unlike earlier time periods, where corporations focused on performance and competence among elite segments of the population, the number of stakeholders and the expectations they have was continuously expanding. One of the consequences of global scale was an operational footprint that touched more communities, more labor markets, more ecosystems, and more regulatory jurisdictions than at any previous point in history. Not only did supply chains stretch across continents but digital products also reached billions of users and financial instruments connected pension funds in one country to mortgage debt risk in another.[108] The sheer scale and interconnectedness of the modern enterprise meant that the consequences of corporate decisions radiated outward in ways that were difficult to anticipate and impossible to identify in all of its permutations.

Scrutiny of an institution's legitimacy covered a wide range of domains and stakeholders such as the public, media, governments, advocacy organizations,

DOWNLOAD THE BOOK PROPOSAL

employees, investors, and consumers. In the Reputation Era, the widening of a jury meant juggling a wider range of expectations. Employees now expected ethical leadership, fair wages, and workplace engagement. Consumers expected transparency, sustainability, and alignment with their values. Governments expected contributions to broader societal benefit as well as compliance with rapidly evolving regulatory frameworks.[109] Investors began factoring reputational risk against performance into their capital allocation decisions.[110] NGOs and advocacy organizations focused on human rights, fair markets and mitigation of shared societal harms.[111] Local communities reinforced the need for balance and fairness that protects local economies, supports small business, and creates pathways for entrepreneurs. The result was a new governance reality, corporations would face more points of friction, more pathways for voice, more ways for legitimacy to be contested.

The speed of scrutiny became another defining characteristic of the Reputation Era. A company could face reputational escalation from a viral social media clip, a niche

podcast, or a coordinated online narrative within hours.[112] Because algorithms reward virality more so than verification, the result became a decentralized news ecosystem where disinformation and the deliberate spreading of propaganda to deceive or cause harm, found fertile ground.[113] Those responsible for protecting a corporation's reputation were reminded of what Edward Bernays had established years prior. Emotionally engaging content spreads faster than rationally driven messaging. In the Reputation Era, that insight was no longer merely a principle of persuasion. It was a structural condition of the information environment.

Efforts to balance the information ecosystem, through moderation of harmful content, introduced another layer of contest. Platform interventions designed to curb misinformation frequently became flashpoints themselves, as moderation efforts were framed by critics as censorship or viewpoint suppression. Throughout the COVID-19 pandemic, platform companies faced accusations of "non-governmental censorship" when they removed or limited the reach of vaccine and public health content which was considered to be misleading or false.[114] Whether accurate or exaggerated, the

DOWNLOAD THE BOOK PROPOSAL

perception became operationally real. In a fragmented environment, the act of removing or labeling content could become as controversial as the content itself. The tools designed to restore shared truth often deepened the very divisions they were intended to heal.

Allegations of political bias became so salient that concerns about anti-conservative moderation were widely cited as contributing factors in Elon Musk's 2022 decision to purchase Twitter and roll back several anti-misinformation policies, including the reinstatement of previously suspended accounts.[115] Efforts to self-moderate and adjust the narrative toward a shared one led to increased scrutiny that further undermined institutional credibility. Attempts throughout the Reputation Era to build trust in news and content were often met with further erosion because contestability had become a self-reinforcing condition. Every intervention designed to stabilize the information environment generated new grounds for contestation.

The self-reinforcing condition that diminished credibility became a virus spreading across the entire institutional landscape. Trust declined not only in corporations, but in governments, media, science, religion, education, and finance. In the United States, confidence had fallen across the board since the 1970s. Over five decades, the proportion of Americans expressing "a great deal" of confidence in these institutions

[115] *Social media moderators do go after conservatives*. (n.d.). Retrieved February 26, 2026, from https://www.theregister.com/2024/10/03/social_media_conservative_moderation/

DOWNLOAD THE BOOK PROPOSAL

dropped anywhere from ten to twenty percentage points, with Congress and news media registering the lowest levels, roughly one in ten.[116] These trends were not confined to the American experience. Across democracies, similar patterns emerged.

Trust declined across institutions. By the mid-2020s, only one in four American adults claimed to trust newspapers, television, and radio.[117] According to the 2024 Edelman Trust Barometer, only 54 percent of global respondents reported trusting businesses, a figure that had stagnated or declined in many markets over the preceding decade.[118] Gallup's 2025 Confidence in Institutions survey reinforced the pattern showing 43 percent of Americans as expressing "very little" confidence in big business, up fourteen percentage points since 2002. That placed big business among the lowest-ranked institutions, only two points below the U.S. President and five below television news.[119]

In earlier periods of corporate controversy, other institutions, such as journalists, scientific experts, and government bodies to name a few, could still function as referees and credible collaborators. Authority was more balanced and aligned. A

media network's interpretation of a crisis was mostly believable. A regulatory body finding was perceived to carry weight. Scientific reports provided consensus that could settle a dispute. Today, corporations are judged in a credibility depleted ecosystem.[120] In an environment without trusted referees, every claim is contested, every defense meets skepticism, and reputation becomes both more volatile and even more consequential.

For corporations, the evaporation of credibility would undermine its own efforts to do the right thing. A company could fund environmental commitments, issuing a detailed sustainability report that critics would simply dismiss as greenwashing. Actions to build a diverse and inclusive workforce would be framed as performative. Making public statements to address societal issues that stakeholders expect companies to address, would lead to different, potentially delegitimizing, interpretations through highly partisan media channels. The greatest irony of the Reputation Era arises, the act of defending one's legitimacy had become, in many cases, a fresh occasion for its own contestation. Reputation professionals found themselves trying to build trust with audiences who had been conditioned, by decades of institutional failure and information fragmentation, to distrust the very act of institutional communication. The ground was not merely uneven. The soil itself had turned hostile.

DOWNLOAD THE BOOK PROPOSAL

Contestation was not confined to digital platforms, advocacy campaigns, or regulatory proceedings. It extended into the cultural imagination, where the structural shifts described in previous sections were translated into symbols, narratives, and moral shorthand that shaped how ordinary people understood corporate power. By the late 1980s, the transformation of corporate governance had become visible enough to enter popular culture. In 1987, Oliver Stone's film *Wall Street* captured the spirit of the era. At the center of the story was Gordon Gekko, a fictional corporate raider who delivered what became one of the most quoted lines in financial history: "Greed, for lack of a better word, is good."[121] The film portrayed insider trading, leveraged acquisitions, and the ruthless pursuit of shareholder gain. Gekko was both villain and antihero, charismatic and corrosive.

The cultural impact was significant. "Greed is good" became shorthand for an era in which capital discipline, takeover battles, and shareholder returns dominated headlines. For some, it symbolized necessary correction after the stagnation of the 1970s. Greed, once defended as disciplined incentive alignment, was recast by many as imbalance and moral failure. Culture rarely preserves context and nuance, but it does create symbols. The movie *Wall Street* gave the decade a durable shorthand for a time marked by greed. Later moments of economic stress would revive the symbol in

[121] *AFI|Catalog—Wall Street*. (n.d.). Retrieved March 1, 2026, from https://catalog.afi.com/Catalog/moviedetails/57877

new form. When inflation returned in the Reputation Era, the term "greedflation" spread as a ready narrative for price pressure interpreted as profit-taking.[122] The recurrence illustrates how quickly structural incentive shifts become reputational judgments once they are translated into everyday experience. Financial engineering could be rationalized on spreadsheets, but legitimacy was contested through the zeitgeist, quick takes, and headlines. And headlines, by their nature, always simplify.

For decades cultural moments showed society was picking up on an under current vibe. "Something feels wrong here." A view from boardrooms and across capital markets showed returns that appeared rational, efficient, and indicative of growth. That view contrasted with the lived experience in many local communities. Prosperity felt slower, uneven, and less directly connected to corporate success. What was felt to be "wrong here" was a K-shaped economy, which is a divergence where different sectors, industries, or income groups experience vastly different outcomes. Nothing more effectively exposes divergent perspectives, and reputational stress fractures, more than a systematic breakdown.

In 2008, that systematic breakdown came. A global financial system, loaded with high risk mortgage debt, trembled. The federal government intervened to prevent systemic failure, deploying extraordinary measures to stabilize institutions whose

[122] *GREEDFLATION definition and meaning | Collins English Dictionary*. (2026, February 25). https://www.collinsdictionary.com/dictionary/english/greedflation

DOWNLOAD THE BOOK PROPOSAL

collapse threatened the broader economy. To policymakers, intervention was necessary to prevent collapse. To many households, however, the optics were stark. Large institutions received stabilization funding and executives retained compensation packages, while households absorbed foreclosures, unemployment spiked, and retirement accounts shrank.[123] The crisis exposed how risk and consequence could be widely distributed downward while protection concentrated upward. It surfaced a perception that the financial architecture rewarded scale and absorbed failure differently depending on position within the system. 2008 was much more than a simple downturn; it was a legitimacy fracture. And unlike previous economic crises, it unfolded inside the fragmented information environment, which meant that the narratives it generated were diverse, contradictory, and impossible to contain.

The crisis cemented the core philosophy of the Reputation Era: great power and responsibility are intricately, and uncomfortably, linked concepts. However, as corporate scale amplified, responsibility was perceived to be lacking among the most influential actors in society. The burden fell not just on corporations, but those that were perceived to benefit the most from corporate prosperity. The perception that societal elites hold a disproportionate influence on setting the rules of the game became a moniker of the populist movement. The Fairness Foundation's 2025

"Inequality Knocks" report found that 63 percent of Britons believed the very rich had too much influence on politics, while 68 percent said ordinary people had too little. In the same study, 40 percent of Britons claimed that businesses wielded excessive political influence.[124] A 2025 survey conducted by Data for Progress among American voters produced similar findings: 73 percent believed billionaires had too much influence over federal government decisions, 67 percent said the same of corporations, and 66 percent of CEOs.

Where corporate influence felt most acute was on the question of broader societal wellbeing. According to Eurobarometer, 93 percent of Europeans believed that businesses should be guided by social economy values, focusing on social and environmental goals, redistributing profits, and operating with democratic governance structures.[125] A 2024 survey by JUST Capital reinforced the contrast, respondents were far more likely to believe companies had a positive impact on shareholders (73 percent) than on local communities (53 percent), society overall (45 percent), or the environment (34 percent).[126] The Reputation Era, in short, was a time

where large, highly influential institutions were perceived as prioritizing profits over societal wellbeing. Big business was mired in a growing perception that corporations were self-serving institutions operating at a comfortable distance from the consequences and risks that their scale produced.

With trust in corporations in decline, the notion of capitalism as a broken system became the next logical conclusion. According to Pew Research, public sentiment had become more critical of capitalism in recent years, with polling showing declining favorability toward capitalism in the United States and growing ideological polarization around the system.[127] The Reputation Era often felt like a revolt against capitalism, but that framing was superficial. What could be found deeper was a reckoning with its incentive architecture. Over five decades, incentive redesign and capital mobility had converged. Leverage shifted upward and distribution tilted.[128] Uneven ground did not automatically create injustice, but it significantly shaped perception. Most business leaders up to this time in history assumed reputation risk arose mostly from scandalous unethical events. In the Reputation Era, risk became a continuous ambient presence not because of a scandal, but because the ground people stood on became visibly uneven and societal consequences felt unresolved.

Reputation risk moved from being episodic to a structural condition of the modern day business environment.

This erosion of legitimacy was not solely the result of external societal pressure or political polarization. It was the outcome of corporate structural limitations. While reputation was increasingly recognized as consequential to institutional legitimacy, it remained structurally siloed, underpowered, and disconnected from the core decision-making systems that ultimately shaped it. Communications, policy, HR, and legal teams generally lacked the unilateral power to reshape business models, incentive systems, or capital allocation decisions that drove the very perceptions they were asked to manage. As a result, many trust-building efforts, even the most well-intentioned, appeared reactive, fragmented, or performative. Some began and then stalled entirely. The 2025 European Parliament and Council decision to scale back key sustainability regulations, such as the Corporate Sustainability Due Diligence Directive, illustrated a familiar pattern. Implementation timelines were delayed and the number of companies covered was reduced under competitive pressure.[129] Delays were not simply the result of economic headwinds, they reflected the structural difficulty of internal transformation required to execute ambitious responsibility

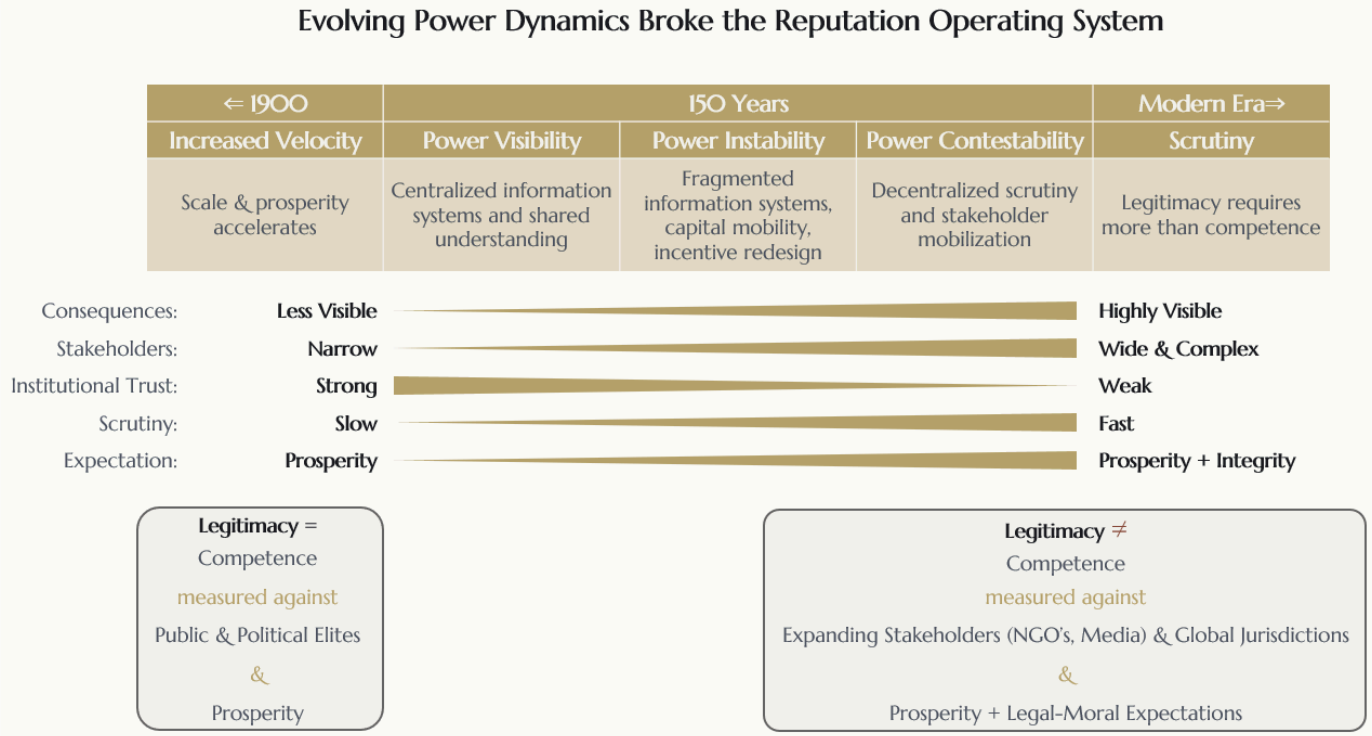
commitments. The gap between what corporations promised and what they could structurally deliver became, itself, another source of contestation.

This is the condition the modern institution inhabits. Legitimacy is no longer inherited or assumed. It must be continuously forged under pressure, inside fragmented information systems, amid persistent distrust, and across stakeholder expectations that shift faster than internal structures can accommodate. Reputation, in this environment, is not image management. It is the infrastructure of continued operability. The reputation operating system was built for an era of slower information, more stable institutions, finite sets of elite stakeholders, and a more centralized narrative authority. The reputation operating system was built for an era of slower information, more stable institutions, a finite set of elite stakeholders, and more centralized narrative authority. It is no longer capable of carrying the weight now placed upon it. Just as economic and information systems were redesigned, the reputation operating system must be rebuilt.

As power dynamics shifted, the Reputation Era took shape in a linear progression:

1. Power became highly visible.
2. Exposed asymmetric power introduced instability.
3. Instability became a foundation for power contestability.
4. Contestibility accelerated into delegitimizing scrutiny of power.

DOWNLOAD THE BOOK PROPOSAL



The state of this era is one of continuous scrutiny and skepticism. But the contest of legitimacy is not a formless, unstructured landscape. It organizes itself around specific domains, which provide recurring patterns through which stakeholders evaluate whether corporate power is being exercised responsibly. In the modern era, corporate legitimacy is now tested, challenged, and, at times, broken in four domains. The first is *Balance*: the question of whether corporate scale produces outcomes that are perceived as fair, whether prosperity is shared or concentrated, and whether the distribution of benefit and burden is sustainable. The second is *Influence*: the question of whether corporate power over markets, governance, and public discourse is exercised within boundaries stakeholders consider acceptable. The third is *Dignity*: the

DOWNLOAD THE BOOK PROPOSAL

question of whether the people touched by corporate operations, employees, communities, and populations within supply chains, are treated with the respect and protection that modern norms demand. The fourth is *Shared Impact*: the question of whether corporate activity contributes to or degrades the common systems, environmental, democratic, and social, on which collective wellbeing depends.

These four domains are not abstract categories. They are the surfaces on which legitimacy is won or lost, the arenas where the contestation takes operational form. Together, they constitute the architecture of scrutiny that defines the Reputation Era. They function as constraint mechanisms, and they determine whether a corporation's license to operate endures or erodes.

Chapter 3: Contesting Corporate Legitimacy

Passage 8: Domains of Scrutiny

Summary Text (Not Included in Final Copy): In the Reputation Era, legitimacy is no longer a byproduct of competence but the result of ongoing judgment across domains where corporate power creates consequence. As firms have scaled, scrutiny has concentrated in four key areas: balance, influence, dignity, and shared impact. These domains reflect where institutional actions intersect most directly with stakeholder expectations, often across competing legal, social, and moral frameworks.

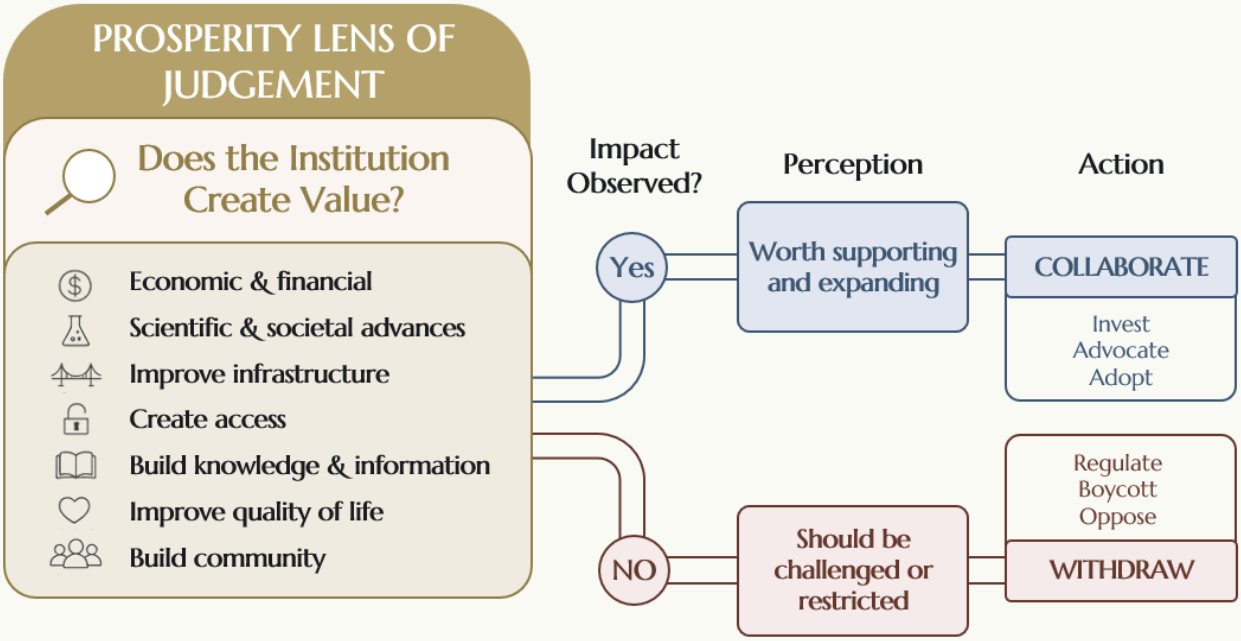
DOWNLOAD THE BOOK PROPOSAL

Together, they form the structure through which reputation is evaluated and institutional legitimacy is continuously negotiated.

Reputation is now determined by how institutions are judged across domains where their power, influence, and actions create consequence. The result, in the Reputation Era, is one where legitimacy is increasingly tested across distinct domains of scrutiny. Across industries and issues, scrutiny tends to concentrate in four recurring domains where corporate behavior is interpreted and judged: balance, influence, dignity, and shared impact. These domains represent the primary arenas where a company's license to operate is either reinforced or strained, and where the conditions for long-term business sustainability are ultimately determined.

These domains of scrutiny were not always the primary lens through which corporations were judged. In earlier periods, corporate legitimacy was largely inferred from competence and the prosperity it produced. Economic contribution, growth, and employment provided a sufficient enough signal that an institution was operating in alignment with societal expectations. Before the Reputation Era, institutions could earn legitimacy primarily through prosperity; as long as they were perceived as creating value, they gained support and expanded. But as corporations scaled, and evolved, that condition changed.

DOWNLOAD THE BOOK PROPOSAL



The expansion of corporate power extended the reach of business decisions beyond markets and into the systems that shape everyday life. Firms began to influence labor conditions, environmental systems, information flows, and the stability of communities. What was once largely contained within an economic frame came to produce social, political, and technological effects that were increasingly visible, attributable, and unevenly experienced. As impact expanded, so too did the stakeholder landscape. In the Reputation Era, corporations are evaluated simultaneously by employees, regulators, investors, media, and the public, often across multiple markets and jurisdictions. These stakeholders do not share a single standard of judgment. For some, scrutiny follows codified law and regulation. For others, it is shaped by more fluid social and moral expectations.

These overlapping legal and moral expectations have intensified as corporate capability has accelerated. Advances in technology, capital mobility, and global integration allow institutions to scale and operate at speeds that exceed the systems designed to govern them. The result is a persistent gap between what corporations are capable of doing and the frameworks available to evaluate whether those actions are acceptable. In that gap, a defining tension of the Reputation Era emerges. Corporations were built to optimize performance and scale, but must now satisfy a broader set of social and moral expectations they were not designed to satisfy. The systems that defined success inside the institution are no longer the same systems that determine legitimacy outside of it. For example, a corporation can prevail in a legal forum while losing acceptance with employees or the public. It can gain support from investors and suppliers while facing resistance from regulators and consumers.

The traditional reputation operating system broke.Models that once translated operational competence into broad legitimacy could no longer reliably convert capability into durable acceptance. As scale increased, so did the visibility and consequence of corporate behavior, and with it, the expansion of scrutiny into new domains. Scrutiny did not disperse evenly, it concentrated in specific areas where corporate power intersects most directly with its consequences. These are the points where tradeoffs become visible, where externalities surface, and where stakeholders experience the effects of institutional decisions most acutely.

DOWNLOAD THE BOOK PROPOSAL

Four domains of scrutiny emerged, reflecting these recurring points of consequence concentration. These domains are not independent. Pressure within one often cascades into others. Perceived imbalance can raise questions about influence. Concentrated influence can intensify scrutiny of shared impact. Failures in shared systems can quickly become questions of dignity. What begins as a localized issue can expand into a broader challenge to legitimacy. This is the structure of the reputation operating system in the modern era. Legitimacy can still be earned through prosperity, but remain contested, and renegotiated within domains of scrutiny. Understanding these domains is essential. They define where scrutiny concentrates, how corporate conduct is interpreted, and whether institutions retain their license to operate.

DOWNLOAD THE BOOK PROPOSAL

The Four Domains of Scrutiny

		Judgement Lens	How Legitimacy Strains
Balance	Distribution of benefits, risks, and responsibilities	Equality, equity, fairness, proportionality, reciprocity	Legitimacy is compromised when stakeholders perceive misalignment, risk deflection, and a lack of shared gains.
Influence	Concentration of power to shape systems and outcomes	Control, access, gatekeeping, dependency, concentration, leverage	Legitimacy becomes contested when corporate power shapes access, direction, rules, and opportunity.
Dignity	Treatment of individuals and groups	Rights, agency, autonomy, respect, voice, exploitation	Legitimacy erodes when individuals are perceived as secondary to economic or operational goals.
Shared Impact	Externality effects on collective systems	Community impact, public well-being, environmental harm, quality of life	Legitimacy is strained when harm becomes visible, measurable, and attributable across shared systems.

Passage 9: Perception is Reality

Summary Text (Not Included in Final Copy): The question of balance emerges when stakeholders confront how the benefits and burdens of corporate activity are distributed. What appears as innovation and efficiency within the firm can be experienced as displacement or exclusion outside of it. In this gap, legitimacy is no longer earned through the production of prosperity alone, but through how the benefits and burdens of that prosperity are accessed, distributed, and shared.

Legitimacy is compromised when stakeholders perceive misalignment, risk deflection, and a lack of shared gains. When the behaviors, communications, or externalities

associated with a company are perceived as uneven, unfair, or lacking reciprocity, stakeholders respond by constraining the institution's license to operate. Like the other three, the Balance domain of scrutiny can produce tangible consequences. Perceived violations can trigger boycotts, invite regulation, and prompt other restrictions that disrupt business operations. However, perceptions of balance can be easily contested and may be very difficult to quantify and defend. One of the most persistent and growing ideas in modern business is the belief that large corporations undermine the ability of smaller businesses to thrive and succeed. This argument reflects a recurring tension in how stakeholders interpret balance. It not only underpins anti-trust headwinds, but also serves as a powerful narrative used to mobilize public sentiment, serving as a powerful story to stir populist emotion, leveraged by politicians and activists to build momentum with their constituents.

The argument of imbalance within the systems that companies create feels authentic and believable as it can be easily rooted in observable shifts in the economic landscape; an issue lying in close proximity to increasing global wealth gaps.[130] To that end, the facts are undeniable, the expansion of large corporations has significantly reshaped local and global economic ecosystems. Through economies of scale,

DOWNLOAD THE BOOK PROPOSAL

vertically integrated supply chains, platform dominance, and highly sophisticated logistics and data capabilities, large firms compete aggressively on price, speed, and convenience. These structural advantages allow them to deliver frictionless consumer experiences at costs and efficiencies that independent businesses often struggle to match. What appears to consumers as innovation and value can, over time, produce a competitive terrain defined by the rules, standards, and limitations set by larger players. Take for example, Walmart, which offers one of the most frequently, and aggressively, studied examples of small businesses displacement. Research by economist Emek Basker, from the University of Missouri, found that the opening of a Walmart store increased retail employment in a county initially, but also displaced workers at existing local retailers.[131] A later study by Artz and Stone (2012) found that Walmart entry was associated with declines in small retail establishments in rural Iowa counties, particularly in general merchandise categories.[132] Other research, including work by Panle Jia Barwick, Economics Department Chair at University of Wisconsin–Madison, authored "*What Happens When Wal-Mart Comes to Town*" which modeled how large "big-box" entry leads to the exit of small, less productive

DOWNLOAD THE BOOK PROPOSAL

retailers who cannot compete on price due to scale disadvantages.[133] This is how imbalance becomes visible to stakeholders, not as a settled fact, but as a pattern inferred from uneven outcomes such as limited access to distribution, increased barriers to entry, and compressed margins for smaller firms. It also underscores that certain communities, and the small businesses within them, have undeniably felt squeezed.

This is where some issues that drive scrutiny within the balance domain can become convoluted. Because the evidence, in some cases, is far from one-sided. Looking at the other side of this issue, large companies also create massive supply chains that small businesses can plug into. The resources and support that large corporations offer enables small businesses to generate foot traffic, building a more flexible and dynamic infrastructure. DoorDash's 2024 US Economic Impact Report states that the platform supported more than $106 billion in economic activity and that local businesses generated over $40 billion in revenue on the platform in 2024, connecting small shops, restaurants, and merchants with customers they otherwise might not reach.[134]

There is third party research that substantiates the claim, that large scale gig work platforms (including DoorDash, Grubhub, Uber Eats to name a few) increased total takeout sales for restaurants and have contributed to positive spillovers such as dine-in customer visits; further supporting the argument that large scale technology platforms can introduce new customers who then return to the restaurant more broadly.[135]

Yet many restaurant owners, political leaders, and media narratives counter this story, with a focus on compressed margins, loss of direct customer relationships, and dependence on platforms that control pricing and visibility.[136] This underscores a reputational challenge where both narratives, told across a range of different reputational stakeholders, can be simultaneously true. The truth that large corporations can support the small business ecosystem can be exemplified by increased access to entrepreneurial tools, particularly through digital ecosystems such as social media networks, online marketplaces, and content platforms like YouTube. These infrastructures lower traditional barriers to entry by giving individuals access to distribution, marketing tools, analytics, payment systems, and global audiences that

would have once required substantial capital to build independently. Entire categories of work, from content creation and influencer marketing to app development, e-commerce storefronts, and creator-led brands, have emerged because large platforms supplied the technological backbone. According to *Entrepreneur*, YouTube helps small businesses build credibility and expand their customer base by giving them access to a vast global audience and powerful visual storytelling tools. By leveraging SEO, engaging content, and direct audience interaction, small businesses can increase brand awareness, drive conversions, and even generate new revenue streams at a fraction of the cost of traditional advertising that many small businesses cannot afford.[137] These examples counter the argument that while large businesses may have stifled some small businesses, there are several cases where small businesses thrived because larger ones built the ecosystems in which they operate. These cases demonstrate that the presence of a major corporation increases overall economic activity and can facilitate a wide range of benefits for smaller, independent business operators.

The jury, in truth, of this hotly debated balance domain of scrutiny issues, is one that remains without concrete conclusion. The relationship between large and small firms

[137] Yadav, S. (2023, July 3). YouTube Is the Tool You Need to Build Your Customer Base—And Your Credibility. Here's How. *Entrepreneur*. https://www.entrepreneur.com/growing-a-business/how-small-businesses-can-harness-the-power-of-youtube/453517

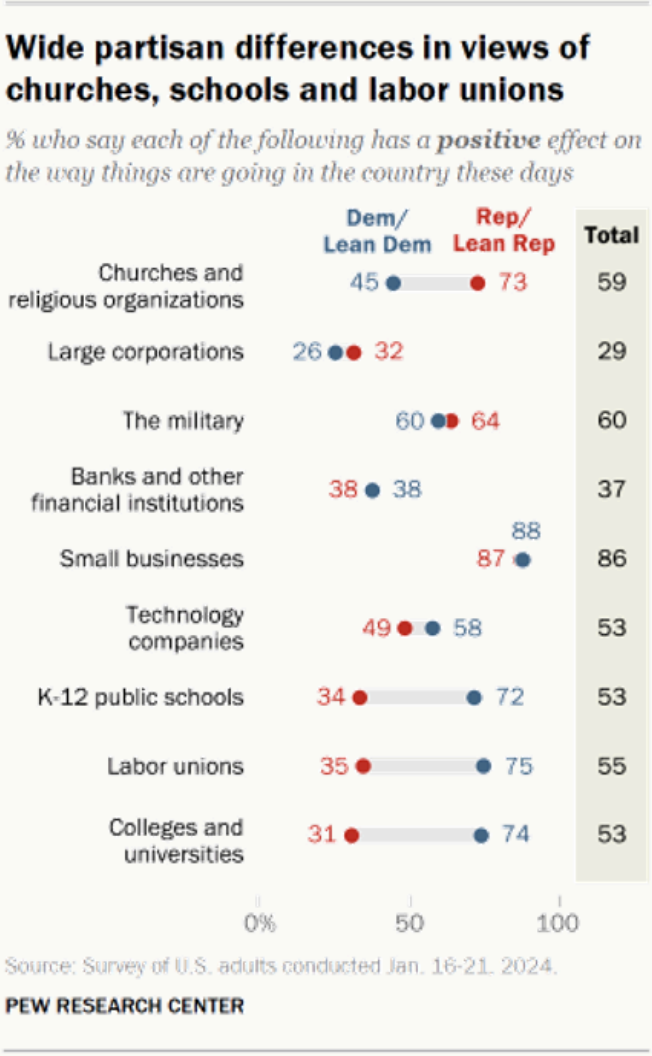
is neither purely adversarial nor purely symbiotic. It is complex, contextual, and evolving. But here is where reputation enters the equation. We do not live solely in a world of empirical balance sheets and peer-reviewed data. We live in a much more complicated, dynamic and fast paced world of perception. And in that world, small businesses hold a powerful advantage, one that often poses significant reputational risk to large businesses. Recent survey data from the Pew Research Center illustrates this vividly. When Americans were asked whether various institutions have a positive effect on how things are going in the country, 86% said small businesses have a positive impact. Only 29% said the same about large corporations. This gap is not marginal; it is seismic. Across partisan lines, small businesses are viewed very favorably with 87% of Republicans and 88% of Democrats claiming small businesses contribute positively. Large corporations, by contrast, earn far weaker endorsement, with just 32% of Republicans and 26% of Democrats saying they have a positive effect.[138] These statistics remind us that the debate of harmful negative externalities imparted upon small businesses from larger corporations isn't a debate in the court of public opinion, here the verdict is nearly unanimous that larger companies are unable to deliver the positive impact that small business delivers.

---

[138] Nadeem, R. (2024, February 1). From Businesses and Banks to Colleges and Churches: Americans' Views of U.S. Institutions. *Pew Research Center*. https://www.pewresearch.org/politics/2024/02/01/from-businesses-and-banks-to-colleges-and-churches-americans-views-of-u-s-institutions/



The numbers bring to life a key reputational theme, asymmetry. Small businesses are perceived as community-rooted, authentic, and vulnerable. They are reputationally protected by perceptions of closeness, vulnerability, struggle, ambition and other human conditions that resonate with people. Large corporations, from the outside perspective, are perceived as powerful, influential, and self-interested. Their scale, success, and reach invites scrutiny; which translates to suspicion. For reputation

DOWNLOAD THE BOOK PROPOSAL

stewards, the key lesson here is that whether or not large corporations are systematically undermining small businesses becomes secondary to the conclusion, and fear, that they have the power to do so. This poses the question, "If a small business, through its localized, in community, personal relationship feels more emotionally human,[139] then does this mean a large globally scaled, with superiorly optimized competence, feels not only super-human in terms of its power and influence, but also sub-human in how it can connects with people emotionally?" This is the awkward tension between scale and scrutiny. Large scale global efficiency is now reframed from strength, to competence, to capability, to an imbalance that feels like dominance. Scale, reach, competency, and capability now become the tool kits by which corporations are perceived to be the creators of imbalance, which lends them vulnerable to perceptions of unfair business practices. The conclusion, in reputation, is that perceptions of imbalance do not need to be universally true to be consequential. They only need to be believed. This is how balance becomes a domain of scrutiny, not resolved by evidence alone, but shaped by how stakeholders interpret the distribution of gains, risks, and power within a system.

Passage 10: Buy it, Bury it, or Block It

Summary Text (Not Included in Final Copy): Legitimacy is earned not only through what institutions produce, but through how they exercise influence over the conditions of participation. The mechanisms covered include patents, acquisitions, digital marketplace platforms, and dark patterns that can shape access, competition, choice, and innovation while remaining legally defensible. These dynamics are intensified by a velocity gap in which corporate scale and speed outpace the systems designed to evaluate and oversee them. Scrutiny shifts accordingly, from what companies deliver to how they shape the systems in which others must participate.

If the Balance domain diagnoses how benefits and burdens are distributed, the Influence domain examines how power shapes those distributions. Legitimacy becomes contested when corporate power is leveraged to influence access, direction, and the conditions under which competition occurs. Where Balance asks, “Are outcomes fair?” Influence asks, “Who decides what is fair?” In this domain, scrutiny centers on signals of control, restricted access, gatekeeping, dependency, and concentration, which stakeholders often interpret as evidence that scale has translated into disproportionate leverage.

DOWNLOAD THE BOOK PROPOSAL

In this context, strategies that may be framed internally as protecting competitive advantage can be perceived externally as crossing into manipulation of the system itself. As corporations scale, so do the mechanisms used to defend their position, raising questions about whether influence is being used to compete within markets or to shape the conditions under which competition occurs.

Society has advanced as global corporations have driven innovation across healthcare, technology, and infrastructure. Yet their growing control over patents, intellectual property, and platform ecosystems is increasingly perceived as a structural barrier to new entrants. In this framing, innovation itself becomes a mechanism of influence, shaping who can participate in the market and under what conditions. The argument points to concentrated corporate power where innovation is perceived to stall, not because ideas are scarce, but because the pathways to market have been systematically narrowed.[140]

Efforts to manage this tension are not new. The patent system, dating back to the 15th century, was designed to incentivize invention by protecting creators while enabling broader economic progress. In early commercial centers like Venice, patents helped attract skilled artisans and supported the development of competitive advantage at

DOWNLOAD THE BOOK PROPOSAL

the state level.[141] In an ironic twist, that same system now faces scrutiny. Critics argue that patents are increasingly used to build self-reinforcing structures of control rather than to expand innovation. Because patent filings are publicly disclosed, patterns of accumulation become visible and open to interpretation. Rapid growth in filings has contributed to what is often described as a "patent thicket"[142], a dense web of protections that can function as a strategic moat. The question shifts from whether patents enable innovation to how they shape access to it.

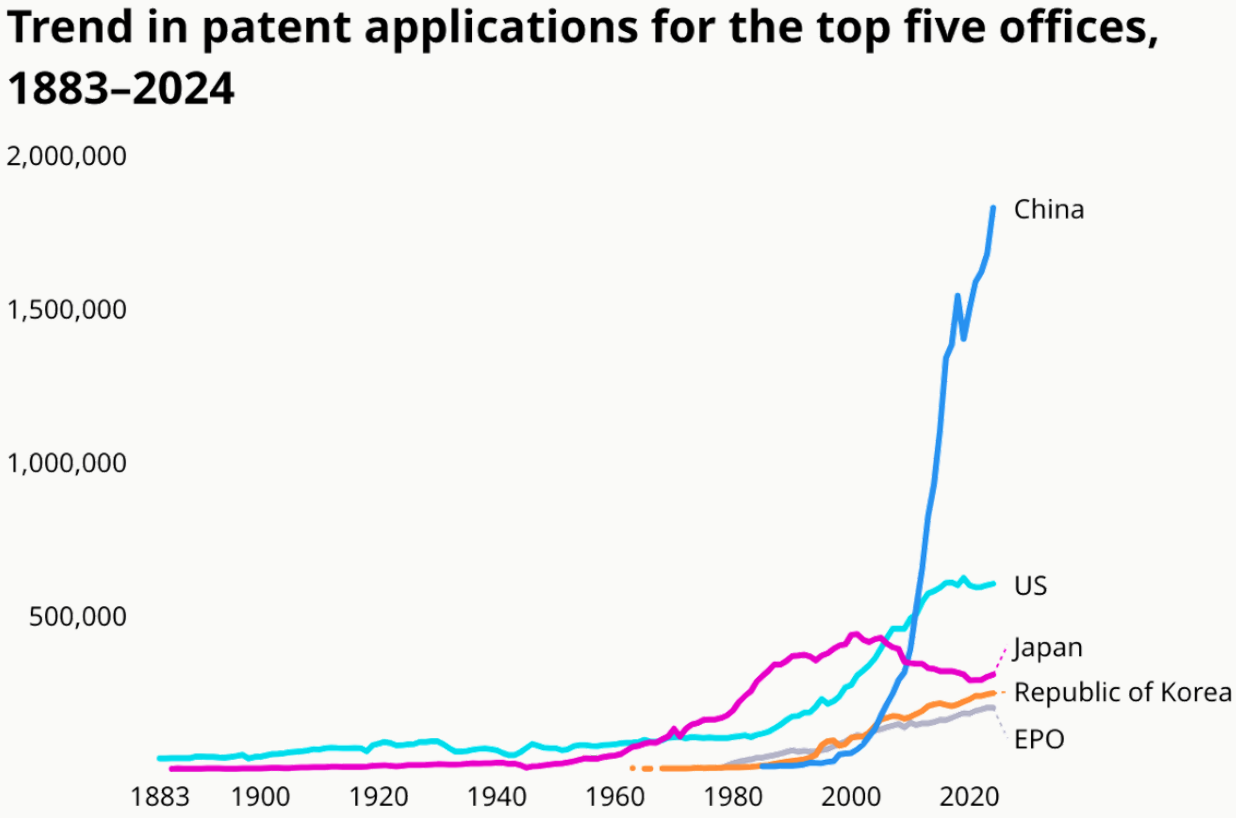
DOWNLOAD THE BOOK PROPOSAL



Patent thickets represent one of the most sophisticated forms of this dynamic. Firms build layers of secondary protections around core innovations, creating barriers that are costly and time-consuming to navigate. This approach is particularly visible in the pharmaceutical industry[143], where breakthroughs in treatment coexist with persistent concerns around affordability and access. For potential competitors, entry becomes complex. Developing alternatives requires navigating overlapping protections, each

DOWNLOAD THE BOOK PROPOSAL

carrying the risk of litigation. The cost of challenging these structures, often reaching millions per case, creates practical barriers that can limit competition.[144] This dynamic produces what economists describe as deadweight loss, where value is lost because market conditions, shaped by concentrated influence, prevent mutually beneficial outcomes. These effects are not abstract. Studies suggest that cost pressures contribute to real-world behaviors such as patients rationing or skipping medication.[145] The innovation exists, but the system governing access to it remains contested.

This interpretation does not go uncontested. Defenders argue that the cost and uncertainty of innovation require mechanisms that allow firms to recover investment. Without protection, the incentive to pursue high-risk breakthroughs may diminish. Patents, in this view, protect not only profit, but the willingness to pursue treatments that may fail.[146] This creates a persistent tension. Structures perceived as restricting access may also be the conditions that enable innovation. Legitimacy therefore depends not on one interpretation prevailing universally, but on how stakeholders assess the tradeoff between protection and access.

Patent thickets are one expression of how influence creates dynamics that place companies under scrutiny. Another is the "killer acquisition," where a dominant firm acquires an emerging rival to neutralize a competitive threat. In some cases, the acquired product may be slowed, redirected, or deprioritized in ways that limit its ability to challenge the incumbent's core business.[147] While these strategies may appear rational internally, they are often interpreted externally as shaping the conditions of competition and narrowing the pathways through which innovation can emerge.

The FTC's antitrust suit alleged that Facebook acquired Instagram and WhatsApp as part of a "buy or bury" strategy to eliminate competitors and protect a monopoly in social networking.[148] The CEO, Mark Zuckerberg, disputed this characterization, stating that the acquisition reflected product strength rather than defensive intent.[149] Internal communications, including the statement, made by Mark Zuckerberg, that "Instagram can hurt us," intensified scrutiny by reinforcing the perception that the

platform was viewed as a competitive threat worth acquiring for defensive purposes.[150]

Despite these concerns, the case did not result in a monopoly ruling. U.S. District Judge James Boasberg found that the FTC failed to establish that Meta currently holds monopoly power in personal social networking.[151] The court emphasized the difficulty of proving harm in markets that have evolved significantly since the acquisitions, noting that changes in the competitive landscape complicated the FTC's claims.[152] This distinction highlights a broader structural gap. Legal systems evaluate harm through defined thresholds, while reputation is shaped by perception and broader social interpretation. As a result, legal outcomes do not necessarily restore or secure legitimacy. In some cases, they intensify scrutiny by reinforcing the perception that existing frameworks are not equipped to evaluate modern forms of influence. This gap is particularly visible in digital markets, where traditional benchmarks struggle to capture non-price harms such as reduced privacy, diminished future competition, or

DOWNLOAD THE BOOK PROPOSAL

structural entrenchment.[153] This divergence reflects a deeper velocity mismatch. The speed at which corporations can scale, acquire, and reshape markets now exceeds the pace at which legal and regulatory systems can interpret and respond. Acquisition velocity, platform scaling velocity, and product iteration cycles operate in compressed timeframes, while governance systems remain dependent on slower processes of evidence, consensus, and enforcement. In this governance velocity gap, influence is not only exercised, but compounded before it can be meaningfully evaluated.

This gap moves from theory to visibility with the rise of the modern corporate platforms, such as Amazon, Google, and Apple. As these companies evolve from participants (creators of applications) in markets to the infrastructure of markets themselves (distribution channels of mobile applications), scrutiny shifts accordingly. This creates what regulators increasingly describe as the "referee and player" paradox.[154] When a company both operates in and sets the rules for the marketplace. Platforms gain structural, imbalanced, advantages that other participants cannot replicate. These advantages are reinforced by access to privileged data. Platform companies can observe how users behave, which features gain traction, and where value is emerging. That visibility allows them to identify and act on product

deployment opportunities before the broader market can respond, enabling forms of self-preferencing that shape outcomes at scale.[155]

As a result, influence increasingly shapes not only competition but the conditions under which entrepreneurs attempt to compete. Smaller firms now navigate not only market demand but a "Kill Zone", where success will trigger competitive responses from dominant platforms.[156] In these conditions, entrepreneurs report a narrowing window of time to capture value before platform replication ensures. This results in diminished innovation, through weakened entrance for new startups.

Previous examples demonstrated how influence can be perceived as shaping markets and competition, but influence extends beyond this, it can shape behavior itself. In the Reputation Era, marketplace environments may appear voluntary, yet the conditions under which users enter, remain, and exit are often structured in ways that guide them toward choices the company prefers. Consider the default settings that make unsubscription harder than enrollment, or the notification sequences designed to discourage opt-out, all designed to generate minor frictions that collectively shape behavior. This is called a dark pattern, strategies designed to structure choices where

certain behaviors are more likely than others, often by introducing friction, defaults, or ambiguity.[157] In these systems, influence is exercised not through restriction, but through the architecture of decision-making.

This dynamic has begun to surface in formal regulatory contexts. In 2023, the Federal Trade Commission brought a case against Amazon alleging that its Prime subscription flows were designed in ways that made cancellation more difficult than enrollment.[158] According to the complaint, users attempting to cancel were required to navigate a series of screens, repeated confirmations, and prompts that encouraged them to reconsider or retain their membership.[159] While each step, in isolation, may appear reasonable, the cumulative experience introduced friction that could delay or discourage exit. While the case has not reached a final judgment, a federal court

allowed the claims to proceed, signaling that questions of interface design and user choice are no longer peripheral concerns.

This is the core of how influential behavior is judged. The question is no longer limited to whether users can technically make a choice, but whether that choice is meaningfully unconstrained. This provides another example of how influence manifests as a domain of scrutiny. Not through overt restriction, but through carefully designed architectures that induce, restrict, or block participation. In such conditions, legitimacy is earned less through compliance with the legal structures governing choice and access, and more through alignment with social and moral expectations for how choice and access should be experienced. Scrutiny of influence extends beyond control of markets; it also encompasses how corporations shape the conditions under which other actors can participate and operate.

This shift is now visible in how stakeholders evaluate corporate behavior more broadly. The Harvard Law School Forum on Corporate Governance highlights, from a Just Capital survey, a critical shift where stakeholders are increasingly evaluating corporate impact across broader societal and innovation outcomes, not simply legal compliance.[160] In earlier periods, corporations were primarily judged against legal constructs that evolved over decades, even centuries. Legal compliance signaled

[160] The Harvard Law School Forum on Corporate Governance

DOWNLOAD THE BOOK PROPOSAL

legitimacy. Today, that presumption is weakening as governance systems are increasingly perceived as struggling to keep pace with the scale and complexity of corporate power. In this environment, corporate preservation strategies that raise barriers, shape participation, delay competition, or limit independent innovation become focal points of scrutiny, even when they fall within legal boundaries. What appears prudent inside the boardroom, as rational competitive defense, is frequently interpreted from outside as an exercise of influence over the conditions others must operate within.

Passage II: Facing a Human Threshold

Summary Text (Not Included in Final Copy): The treatment of people has become a central basis on which corporate legitimacy is sustained or contested. Human rights frameworks transformed dignity into a structured system of scrutiny that now operates through supply chains and labor models. In the Reputation Era, failures in this domain do not remain isolated. They propagate across stakeholders and convert quickly into constraints on a firm's ability to operate.

The Dignity domain focuses on how institutions treat people and how that treatment shapes the judgments on which legitimacy depends. Unlike other domains, where scrutiny often centers on outcomes or scale, dignity is judged at the level of human

DOWNLOAD THE BOOK PROPOSAL

experience. It asks whether individuals are treated as agents with rights and voice, or as inputs to be optimized. When that boundary is crossed, legitimacy erodes quickly, not because performance declines, but because the system is perceived to tolerate externalities that harm its human operators without remedy.

In the Reputation Era, dignity stretches beyond peripheral moral concerns. It has become a significant structure that sets the condition for business operability. The treatment of people now travels across systems, becoming measurable, attributable, and actionable through legal frameworks, stakeholder pressure, and institutional enforcement. As a result, failures in the dignity domain do not remain isolated. Potentially more so than scrutiny in other domains, perceived dignity shortfalls can be characterized by their rapid ability to propagate outward, converting into constraints on access, capital, labor, and business continuity.

This shift to an evolved and understood dignity domain was not an inevitable course through history. Its origin story ties closely to the emergence of a human-rights framework that emerged after a period of significant global failure. The catalyst that drove the ideology shift takes place between 1914 and 1945, a time of compounding violent shocks that include war, engineered famine, mass purge, and aerial terror across different sovereign states. A conservative estimate, from the table below, shows

DOWNLOAD THE BOOK PROPOSAL

110 million casualties (deaths, wounded, prisoners, and missing), which is a rate of about 10,000 per day over a period of 31 years. The global geopolitical system, at the time, discovered that it was stuck in 'failure' mode. This conclusion was bolded and underscored when the United States dropped atomic bombs on Hiroshima and Nagasaki.[161] The resolution of World War II offered a grim reality that atrocity is no longer something that accumulates painfully over years, it is something that can be executed in minutes. From this point forward there would be the need for a new order, not one threaded in virtues of world peace, but one that could contain and restrict instability.

The postwar settlement was designed to prevent a return to catastrophic war by institutionalizing conflict prevention and collective security, so that crises could be contained before they escalated into shocks a system could not absorb[170]. That lesson became the foundation for a human-rights architecture built around constraints, standards, and accountability; purposefully designed to prevent widespread global failure. It eventually led to a broadly adopted code through the United Nations Charter which embedded the treatment of people into the logic of international stability. From this the Universal Declaration of Human Rights[171] established a shared baseline of non-negotiable expectations.[172] These frameworks did not eliminate abuse, but they changed its consequences. A system of standards and penalties became the basis for scrutinizing institutions within the dignity domain. Moving into the Reputation Era, dignity became a visible and widely understood framework across borders. It provided a shared language through which the legitimacy of nations and institutions could be contested when harm to people became evident.

This dignity domain had a significant impact on reshaping reputation through the late twentieth century. It not only established a moral and legal framework for evaluating

institutional conduct, but also expanded the range of stakeholders whose judgments could influence reputation and legitimacy. Institutions could no longer rely on the acceptance of a narrow group of public elites, such as doctors, scientists, and politicians. Scrutiny in the dignity domain pushed institutions to manage relations across a broader and more distributed system of stakeholders, all of which were capable of translating perceived harm into consequence.[173] NGOs[174] and consumer backlash[175] makes perceived abuse visible and portable across jurisdictions. Investors incorporate controversy into risk pricing and capital allocation.[176] Employees and talent markets express preferences through participation and withdrawal.[177] Regulators[178] and courts[179] convert claims into enforceable processes and revised policies. Publicity, in this system, functioned less as commentary and more as pressure, raising the cost and compounding accountability pressure.

For corporations, scrutiny within the dignity commonly enters through two primary operating surfaces which are the supply chain[180] and the labor model.[181] These are the points where institutional design intersects most directly with human experience, and where abstract communications and stated commitments are tested against perceived employee experience and lived conditions. In global supply chains, the mechanics of seeking efficient commercial incentives often move faster than protocols and procedures that ensure accountability. Corporations constantly face market pressures to reduce costs and compress timelines which leads to layers of subcontracting and highly distributed production processes across multiple tiers. This creates a condition for a supply chain that can "leak" into jurisdictions with weaker enforcement and fewer worker protections.[182] These market forces which push and stretch supply lines does not guarantee harm, but it creates an environment where harm becomes both more likely to occur and increasingly difficult to detect. When visibility is lost, the door opens to low wages, excessive hours, unsafe working environments, and exposure to forced or child labor. All of which emerge not only

from isolated misconduct, but also from systemic pressure embedded in procurement and production models. When stakeholders gain visibility into perceived supply chain harms, it triggers scrutiny that can translate into enforcement actions, procurement restrictions, and loss of market access. While supply chains present a pathway to scrutiny within the dignity domain, internal labor systems within the firm also present another arena for reputational risk. Another characteristic of the Reputation Era is the shift within labor models to increased amounts of contracting, gig work[183], and algorithmic management.[184] These systems offer flexibility and efficiency, but they have become contested as shifting economic risk onto workers while also maintaining centralized control over performance, pricing, and evaluation. Under these arrangements, stability declines, benefits narrow, and monitoring expands. Workers may retain formal autonomy, but they experience significantly reduced agency. Over time, these conditions can be interpreted as dignity failures, particularly when workers lack meaningful voice, recourse, or the ability to exit without penalty. The debate surrounding platform-based labor models illustrates this tension. What is framed as

DOWNLOAD THE BOOK PROPOSAL

flexibility can also be perceived as a mechanism for retaining control while externalizing both risk and responsibility.[185]

In more severe cases, these dynamics extend beyond firms to entire international systems. Russia's invasion of Ukraine made this pattern visible at scale. Governments imposed financial restrictions and sanctions, while hundreds of global companies exited the market in response to rising legal and reputational risk.[186] [187] [188] These responses were not centrally coordinated, yet the language of dignity was equally understood and acted upon by nations and companies around the world. The speed of the response highlighted how a human rights framework, coming into increased visibility in the Reputation Era, would become a code that undermines any effort to legitimately continue business in Russia. As a result a majority of global firms reduced or exited operations to de-risk, mitigate, and prevent reputational erosion.[189] Once

violations are translated into sanctions, counterparty risk, and institutional restrictions, consequences propagate across networks because each participant must defend its own operability. This example makes a structural implication clear, when an institution faces significant constraint, as a result of weakened legitimacy, it has entered a state of reputational crisis.

DOWNLOAD THE BOOK PROPOSAL

delegitimization, but they bring logical patterns to scenarios that can appear episodic or subjective. First, not every situation activates every constraint ring, and progression to the next is not always guaranteed. The pattern depends on severity, evidence, credibility, and the degree of stakeholder alignment. In most cases, scrutiny begins with a credibility shock. Stakeholders withdraw interpretive latitude and the burden of proof shifts. Messaging loses traction, trust decays, and verification becomes required through audits, disclosure, and third-party validation. From there, additional constraint rings may activate. Counterparties may tighten terms or exit to protect their own exposure. Legal thresholds may be crossed, triggering enforcement actions. Operational chokepoints can emerge, slowing or conditioning access to key systems such as permits, procurement, or borders. As legitimacy erodes, business continuity comes under pressure, forcing reconfiguration, asset changes, or withdrawal.

Inside the organization, prolonged scrutiny can produce an internal clampdown. Decision-making centralizes, approval layers increase, and the distinction between what is legal and what is acceptable becomes more pronounced. Dignity-related failures can trigger these constraint rings in different combinations. The table below illustrates how they manifested in real world scenarios.

DOWNLOAD THE BOOK PROPOSAL

Crisis Inducing Constraint Rings

Constraint Ring	Case Study
CREDIBILITY SHOCK burden-of-proof shift	**Nike Supply-Chain Labor Allegations (1990s):** brand assurances stopped working, so the response had to shift toward monitoring, disclosure, and verification. (Nike later regained a "voice of the people" posture through culture-defining campaigns, including the 2018 "Dream Crazy" work fronted by Colin Kaepernick.)
COUNTERPARTY AVOIDANCE de-risking	**Apartheid-era South Africa divestment (1980s):** banks, investors, and multinationals tightened terms or exited. Chase Manhattan bank refused to roll over maturing South African debt, triggering a broader credit squeeze and signaling that normal financing could be withdrawn on legitimacy grounds.
ENFORCEMENT ACTIVATION penalties	**Chiquita Payments to Columbia Paramilitary Groups (US, 2001):** acknowledged paying the AUC, a group designated a U.S. Foreign Terrorist Organization. The result was DOJ enforcement, a guilty plea, and a $25 million criminal fine, turning security rationale into legal exposure.
OPERATIONAL RESTRICTIONS procurement and operational rules	**Uyghur Forced Labor Prevention Act (US, 2021):** Forced labor leads to shipments being detained or excluded at the border unless the importer provides "clear and convincing" evidence with end-to-end supply chain documentation and traceability to prove the absence of forced labor.
OPERATIONAL RECONFIGURATION continuity disrupted by redesign	**TotalEnergies (Myanmar post-2021 coup):** Withdrew a pipeline company after the 2021 coup and the deterioration of the human rights environment made continued participation untenable, forcing an exit that required unwinding positions, handing over operatorship, and costly operational reconfiguration.
INTERNAL CLAMPDOWN governance compression	**Rio Tinto Juukan Gorge (Australia, 2020):** Legal permits for expanded mining operations led to the destruction of Aboriginal rock shelters creating pressure on the board from investors and other stakeholders. CEO Jean-Sébastien Jacques stepped down and two senior executives also left.

While viewed through the lens of labor and supply chains, the same logic applies to customers when their safety is compromised. The Boeing 737 MAX failures, which led to 346 deaths[191], demonstrate how breakdowns in design, oversight, and accountability can move directly from internal oversight to external harm. In these moments, dignity surfaces as a measurable human toll. The key conclusion here remains, personal harm is a clear and emotionally connecting signal of a dignity failure. This is a domain where stakeholder accountability and human impact converge. When those elements align, institutions retain the right to operate, but when they do not, constraint is sure to follow.

Passage 12: Scale and Systematic Harm

Summary Text (Not Included in Final Copy): Shared impact emerges as corporate scale produces consequences across systems no single actor controls. What has changed is not the existence of these externalities, but their increasing visibility, measurement, and attribution, which make them legible and contestable. This creates a structural tension between systems optimized for efficiency and stakeholders demanding accountability for diffuse harm. In this environment, shared impact becomes a condition of operability, not a matter of narrative management.

As corporate systems expanded across borders, their effects began to extend beyond discrete transactions into shared systems that no single actor fully controls. This introduces a distinct domain of scrutiny, one centered not on fairness or control, but on shared impact. In this domain, the question is not whether a firm behaves fairly, but whether its operations produce consequences that accumulate across communities, ecosystems, and future time periods. These effects are diffuse, distributed across geographies and future time horizons. Historically, like other domains, shared impact has had challenges with measurement and attribution. For much of the industrial era, that diffusion allowed firms to scale while externalizing societal costs. What changes in the Reputation Era is not the existence of these

DOWNLOAD THE BOOK PROPOSAL

externalities, but their increased visibility, measurement and attribution. As these improve, shared impacts become legible, and once legible, they become contestable.

Environmental exposure provides the clearest expression of this shift because it has progressed further than most shared impact issues along a path from near invisibility to named attribution. As production, sourcing, and logistics expand across jurisdictions, corporate scale becomes harder to observe as a single system.[192] Like dignity issues, shared impact externalities amplify with scale[193], and can be shuffled to regions, typically less developed nations, where guidelines and protections are fragmented and uneven.[194] The result is persistent asymmetry; and asymmetry, as covered in the balance domain, always invites scrutiny. This leaves corporations operating within integrated global systems, while accountability mechanisms remain local, delayed, and incomplete. Inside firms, this creates a different reputational risk, one shaped by narrative fatigue. Shared impact concerns remain in constant repetitive media cycles, framed with urgency and critique, but resolution and actionability is unclear. Reputation managers then view shared impact issues as a

DOWNLOAD THE BOOK PROPOSAL

narrative cycle, instead of understanding it as a structural condition. That interpretation is misleading. Scrutiny of shared impact issues persist not because they are unresolved, but because it is embedded in the architecture of modern, significantly scaled, production systems. This means fatigue within the shared impact domain more commonly signals saturation, not resolution.

In the Reputation Era, shared impact exposure cannot be managed through narrative control alone. When sustainability claims are perceived as symbolic rather than operational, trust erodes and backlash risk increases.[195] Communications may still influence perception at the margins, but they do not resolve the underlying systems constraint. Increasingly, like the dignity domain, shared impact scrutiny, such as environmental performance, serves as a condition of continued business operations. It shapes whether firms can build, permit, insure, finance, recruit, and sustain market access under expanding scrutiny.[196] Public debate often assigns shared impact issues in a moral tone[197], but the mechanisms are more structural than ideological. Issues like

DOWNLOAD THE BOOK PROPOSAL

environmental degradation persist because the systems required to manage it remain fragmented across supply chains, jurisdictions, and accountability regimes.[198] From this perspective, environmental risk is not an anomaly. It is a byproduct of scale operating within incomplete coordination systems.

The tension becomes more visible when viewed through consumption. Corporations compete by delivering lower prices, greater convenience, higher consistency, and faster fulfillment. Consumers respond predictably to these attributes, and the resulting system produces a form of prosperity built on production optimization, not mitigation of shared impact.[199] This leaves consumer prosperity financed through environmental externalization which remains largely invisible at the point of use. More directly, consumers rarely connect the effects of packaging, emissions-intensive logistics, extraction practices, and end-of-life waste at the moment of purchase.[200] For years, these externalities remained abstract because they were dispersed, difficult to quantify, and loosely connected to specific operating decisions. That condition is

now reversing as advances in measurement, traceability, and data access make previously invisible impacts more legible.

This shift introduces a structural contradiction that sits at the center of modern environmental pressure. Stakeholders increasingly demand visible environmental responsibility while remaining habituated to an experience economy built on convenience and cost efficiency. The contradiction becomes most visible when firms attempt to change. This is the experience externality paradox, which captures contradictions among consumers who call for corporations to reduce their shared impact, while expecting their experience with products to remain unchanged. Efforts to reduce environmental harm often introduce trade-offs that are immediately felt by the consumer. Products become more expensive, packaging changes, or convenience declines. Starbucks encountered this directly in South Korea when it replaced plastic straws with paper alternatives. The change reduced environmental impact, but customers complained that the straws degraded quickly and diminished the drinking experience.[201] What appeared as a straightforward sustainability improvement became a perceived decline in product quality. The result is not a resolution of reputational pressure, but a relocation of it. The same system that

DOWNLOAD THE BOOK PROPOSAL

rewards efficiency and convenience creates resistance to the adjustments required to reduce systematic harm.

But environmental exposure is not governed by consumer preference alone. Other stakeholders operate on different timelines and different expectations. Regulators impose requirements, communities mobilize resistance, and investors incorporate environmental risk into capital allocation decisions. Together, these actors create a structural stakeholder wedge in which consumer demand may pull the business forward while its permission to operate is simultaneously contested. This dynamic becomes visible when local environmental issues cascade across stakeholder groups and expand into broader legitimacy contests. Sharon Lavigne, a St. James Parish community leader and founder of RISE St. James, provides an example of grassroots amplification. She became nationally visible for opposing Formosa Plastics' proposed Sunshine Project in Louisiana's petrochemical corridor known as Cancer Alley. Her stance revealed how scrutiny within the Shared Impact domain can move from community opposition into national coalition-building, litigation, and regulatory intervention, transforming local exposure into a significant system-wide constraint on legitimacy.[202]

The Reputation Era reflects a structural change in how impact is seen, measured, and traced across shared systems. Take a breakthrough visibility moment for environmental harm in 1969, when the Cuyahoga River caught fire[203]. an event so extreme that it forced industrial pollution into public consciousness. That same year, the Santa Barbara oil spill brought offshore extraction risks into full view.[204] By 1970, an estimated 20 million Americans participated in the first Earth Day[205], marking a shift from isolated concern to mass mobilization. Visibility changed the conversation, but visibility alone could not foster scrutiny of systemic break points. Measurement would be an important scrutiny catalyst. Ironically, early forms of measurement predated mass visibility. In 1896, Svante Arrhenius quantified the warming influence of atmospheric carbon dioxide.[206] Decades later this finding would serve as an early foundation for understanding shared impact. Over time, coming into the Reputation Era, measurement capacity and accuracy expanded, allowing environmental degradation to be tracked, compared, and regulated across systems.

However, the most significant catalyst to generate scrutiny is attribution. Modern era technologies such as satellite monitoring have begun to convert environmental impact from abstract data into observable, time-stamped events that are tied to identifiable operators. NASA's Earth Observatory has published time-lapse imagery showing deforestation across the Amazon[207], compressing decades of degradation into a visual sequence that requires little interpretation. What once demanded technical explanation becomes immediately legible. The same pattern appears in emissions tracking. Organizations like Carbon Mapper detect methane releases at the facility level and publish them through public data systems, allowing observers to link emissions directly to specific operators.[208] Advances in technologies that measure and attribute shared impact scrutiny has created a shift where generalized accusation becomes verifiable evidence in the Reputation Era. Consider the Earthworks and Gas Leaks in early 2026, which used publicly available Carbon Mapper flyovers to flag "super-emitter" events in the Appalachian Basin.[209] With this the Financial Times

to a shrinking region in Sumatra.[212] When incremental environmental pressure compressed their survival margins, their existence became threatened.[213] Emotions override the need to understand a complex ecological system. A once abstract narrative quickly becomes quickly legible as harm through a visible reduction in shared operating space for living systems.

Shared system constraint also becomes clearer when viewed through finite limitation. Annie Leonard, executive director of Greenpeace USA, captured this directly when she observed that "you cannot run a linear system on a finite planet indefinitely".[214] This statement reframes the issue from one of moral positioning to one of operational feasibility. Environmental exposure is not simply a question of whether firms should act. It is a question of whether existing models of global scale can continue to function within finite resource systems. As environmental measurement improves and the limits of shared environmental resources become more visible and understood, scrutiny shifts from narrative concern to operating constraint.

This shift becomes more visible when distant future concerns suddenly materialize in present day systems. Insurance markets provide a clear example. In regions exposed to increasing climate volatility, insurers have raised premiums, restricted coverage, or exited markets altogether, forcing more risk onto public systems or individuals.[215] What was once treated as a distant environmental issue becomes a direct affordability constraint for business and consumers alike. Extreme weather events serve as a source of ignition. For example as hurricane losses mount, private insurers raise rates, tighten coverage, or withdraw, displacing policy holders. A 2022 Florida law accelerated this shift, forcing policyholders to leave Citizens, Florida's insurer of last resort, if a private insurer offers coverage within 20% of its premium.[216] This explains why scrutiny in the shared impact domain can feel like it is both consistently fatigued, while also being urgent and immediate.

Despite increased visibility, measurement, and attribution, progress remains uneven. The limiting factor is not awareness, but coordination. Environmental systems operate across borders, while governance remains fragmented.[217] Corporate incentives are

shaped by financial expectations and execution capacity.[218] Measurement frameworks continue to evolve, particularly in complex areas such as value chain emissions.[219] [220] At the same time, information environments are contested, with competing narratives of environmental impact intentionally introducing doubt and delay.[221] Perceived credibility gaps further complicate progress. As corporations make sustainability claims that are excessive or exceed operational reality, which is called greenwashing, trust erodes and the burden of proof rises for all institutions in the system.[222] These dynamics only further slow alignment, invite skepticism, and rationalize delay.

And yet, within this system, corporate scale itself can also function as a coordinated solution mechanism. Large corporations possess the ability to influence supplier behavior, set standards, and aggregate demand in ways that smaller actors cannot.

Apple's supplier commitments to renewable energy demonstrate how procurement power can reshape energy use across a global value chain.[223] Walmart's Project Gigaton illustrates how retail scale can drive emissions reduction across suppliers.[224] These examples do not fully resolve a complex systematic problem, but they reveal a structural duality. The same scale that amplifies externalities can also be used to coordinate their reduction.

For the reputation strategist, the implication is direct. Environmental exposure is not temporary and it is not peripheral. It is a standing condition of operating in systems where shared impacts are becoming visible, measurable, and attributable. As these capabilities improve, the connection between the negative externalities of scale and the ability to contest legitimacy strengthens. Taken together, the domains of scrutiny define the conditions under which corporations are evaluated. Fairness shapes perceptions of equity. Control shapes perceptions of power. Shared impact determines how externalities are judged across systems. Dignity defines how people

DOWNLOAD THE BOOK PROPOSAL

are treated within those systems. These domains do not operate in isolation. They form a coupled system of scrutiny, where pressure rarely remains contained within a single domain. A perceived imbalance in how value is distributed can quickly raise questions about who holds influence and how that influence is exercised. Once influence is scrutinized, outcomes that may have once appeared incidental begin to be interpreted as having a greater shared impact. As those impacts become more visible and attributable, they often resolve into questions of dignity, where abstract harm is translated into lived experience. This is how reputational pressure scales in the modern environment, not through isolated failures, but through interconnected strain. And as scrutiny compounds, legitimacy becomes more difficult to sustain.

Commonly, in the Reputation Era, institutions recognize that they are being evaluated in tighter frames. They often administer actions that they believe will satisfy one issue, without recognizing the interconnected nature where domains can intensify pressure in other arenas. Over time, a lack of communications and behaviors to address these interconnected domains translate into further business constraints. Depending on the severity of the constraint it will trigger a reputational crisis. Reputation managers in the modern era should recognize that the ability to operate, expand, and maintain stakeholder alignment is becoming increasingly conditional and contested. In the

Reputation Era, legitimacy is never fully secure. It is continuously negotiated across domains of scrutiny that are structurally interconnected; and this is why reputation is increasingly harder to build than it is to lose.

The Key Conclusion of the Reputation Era: Reputation Needs Infrastructure

The Reputation Era is defined by a structural contradiction that cannot be resolved through reactive communications alone. Corporations are engineered for scale, designed to optimize, expand, and deliver prosperity at great velocity. They were not designed to anticipate, measure, or manage the full spectrum of consequences that this scale can produce. Yet that is now what society demands, and when these demands remain unmet delegitimizing scrutiny follows.

This contradiction that stakeholders place upon corporations is not new to the modern era. What is new is negative externalities becoming visible, measurable, and attributable in real time. For most of corporate history, the lag between action and consequence was long enough to obscure causality and leave legitimacy largely uncontested. Supply chains were opaque, environmental harm was abstract, and labor exploitation felt distant. Globally interconnected systems radically changed distance in the accountability equation, leaving externalities diffused across borders and jurisdictions. While modern era technologies, such as satellite imagery tracking deforestation and emissions, make harm instantly visible across continents. Attribution,

DOWNLOAD THE BOOK PROPOSAL

in the Reputation Era, is increasingly precise and becoming easier to assign. This leaves corporations in the modern era caught between global impact, in terms of both prosperity and consequence, and a widening global consciousness.

The Reputation Era has compromised the communications function of the business. For decades, corporations learned to navigate scrutiny through public relations, namely media engagement. The right message at the right moment could contain a crisis, reframe a narrative, defend a position. That playbook assumed a sizable interval of time between action and understanding, between knowledge and judgment. Today time, like distance, is compressed. The public does not wait for explanations. Narratives form while decisions are being finalized and judgment arrives before context. The organization is asked to answer for consequences that stakeholders have already rendered emotionally settled.

A fundamental asymmetry emerges, business strategy moves at a layered multi-functioned corporate speed while scrutiny moves in a highly fragmented, rapid velocity information speed. The organization attempts to think forward while the stakeholder environment is judging backwards. In this condition, reputation struggles to be built through statements alone. Protecting reputation through narrative management becomes a continuous, and costly, treadmill exercise. At the same time

DOWNLOAD THE BOOK PROPOSAL

reputation cannot be stabilized through simple legal compliance. Reputation, in the modern era, can only be defended upstream, through decisions and incentives that anticipate how power will be interpreted and that make organizations trustworthy at scale before it can be tested. Put simply, reputation must be architected into how the company operates, the incentives it creates, and the values that guide it behaviors. Reputation must migrate from the margins of business life to the center of corporate operability. It must be understood as a system, not an aesthetic annual rank list. It must be integrated throughout the business, not delegated to the communications and legal functions. It must be unlocked as the most valuable strategy that a business cannot afford to omit, not confused as a tactical brand asset. Reputation must be understood as the infrastructure through which legitimacy is earned and sustained, enabling the business to protect and expand its license to operate.

One of the greatest challenges for modern corporations is that reputation has been viewed as “soft”. Categorized as either consumer sentiment, brand equity, public perception, something a company could shape through the right campaign at the right moment. That conception remains the primary lens through which organizations attempt to manage it. Another contradiction emerges, the environment corporations now operate treats reputation as an operational gating mechanism. A condition that determines whether capital clears, whether talent stays, whether regulators

DOWNLOAD THE BOOK PROPOSAL

accelerate, whether permits arrive, whether supply chains remain intact, whether communities consent, and whether the firm can maintain its license to operate at all. This is the structural shift where seven conditions that define the Reputation Era emerge, shown in the STIGMAS model.

	Before the Reputation Era	Reputation Era
Stakeholders	Narrow (government, public elites)	Broad, heterogeneous, global
Trust	Competence delivers legitimacy	Competence alone no longer delivers legitimacy
Information	Centralized, shared reality	Decentralized, continuous, unfiltered
Governance	Legal compliance	Hybrid legal-moral frameworks
Mediation	Institutions acted as referees	Distrust ambient, weak credibility, no arbiters
Attribution	Harms dispersed, opaque, unseen	Measurable, timestamped, labeled
Speed	Scale faster than scrutiny	Information faster than alignment

In this environment, competence alone is no longer sufficient. A company can be operationally excellent and reputationally failing at the same time. That divergence is an architectural feature of modern legitimacy. Institutions face a balancing act where they must deliver performance while also demonstrating integrity, fairness, and accountability across domains of scrutiny that were never part of the original corporate mandate. This creates a structural growth-responsibility paradox in which the incentives that drive corporate behavior; such as optimization, scale, and

DOWNLOAD THE BOOK PROPOSAL

shareholder return, are often at odds with the integrity increasingly required to sustain legitimacy.

Corporations often respond to this paradox with three different business strategies. Some lean into what has worked through history up into the modern era. They lean in and accelerate their scale, betting that speed will outpace scrutiny long enough to entrench power before governance can respond. This strategy has proven that it works remarkably well, until it doesn't, the reputational debt continues to load as an invisible line item on the balance sheet until it becomes collected at a crisis point later in time. Some will deploy purpose driven strategies by leaning into emotional signaling. In many cases they over-correct which leads to performative communications that drive signals such as statements about values, commitments to sustainability, and expanded diversity initiatives to name a few. The majority of which lack behavioral coherence, leaving stakeholders unsatisfied and often deeps skepticism when the gap between promise and practice becomes visible. While others deploy a strategic pause. They either directly or indirectly attempt paralysis, reducing perceived reputation risk through caution, only to discover that inaction is itself still an action, one that is interpreted by stakeholders as either cowardice or complicity.

DOWNLOAD THE BOOK PROPOSAL

None of these approaches resolve the underlying structural contradiction. The problem is not that stakeholders are increasingly holding corporations to standards that exceed legal constructs, holding businesses to a hybrid legal-moral accountability threshold. The problem is that corporations were not intended to be institutions of morality, that is not their primary purpose. This validates why corporate structures struggle to effectively implement an integrity infrastructure within business operations that can meet the expectations of its stakeholders. This is the defining insight of the Reputation Era. Not that corporations have become evil, they're not. Not that capitalism has failed, it hasn't. But that the incentive architecture of modern business was built to reward performance, but it was never recalibrated to integrate multi-stakeholder accountability at the same scale or speed. In other words, the expectations of stakeholders broadened, from the ability of what companies could do, to the integrity of how it was perceived to be doing it.

The Reputation Era proves to be a time of revelation for the modern day corporate executive. But its deepest revelation is an underlying tension that emerged before the idea of a corporation was even conceived, to the first moment where humans first learned to cooperate. This is because reputation, in its most fundamental form, is not a business condition, it is a human condition. It is the mechanism through which societies have always determined who deserves trust, who merits collaboration, and

who can be granted power. That mechanism is built on integrity. And integrity is more than a corporate values statement, it's a survival trait.

The sections that follow examine what reputation actually is and what it is not. They dismantle the persistent confusion between brand and reputation, a mistake that costs organizations billions in misdirected investment and only increases the hidden risks the reputation often carries. Reputation will be tracked back to its origins as a human coordination system, one rooted as a necessity of identifying trustworthy actors in uncertain environments. It unveils the critical truth that many organizations have yet to internalize, that reputation is not something corporations can build, manage, or control. Instead, reputation is the infrastructure that corporations must become. Strategists must decouple the idea that reputation is just a tool, a communications discipline, or a brand asset. They must embrace it as the accumulated judgment of whether an institution merits the trust required to operate at scale. And that judgment, in the end, hinges on a single question that humans have been asking for millions of years.

"Does this actor possess the integrity required to effectively wield the power they have been granted?"

DOWNLOAD THE BOOK PROPOSAL

For corporations to survive in the Reputation Era the answer to that question is no longer optional.

DOWNLOAD THE BOOK PROPOSAL

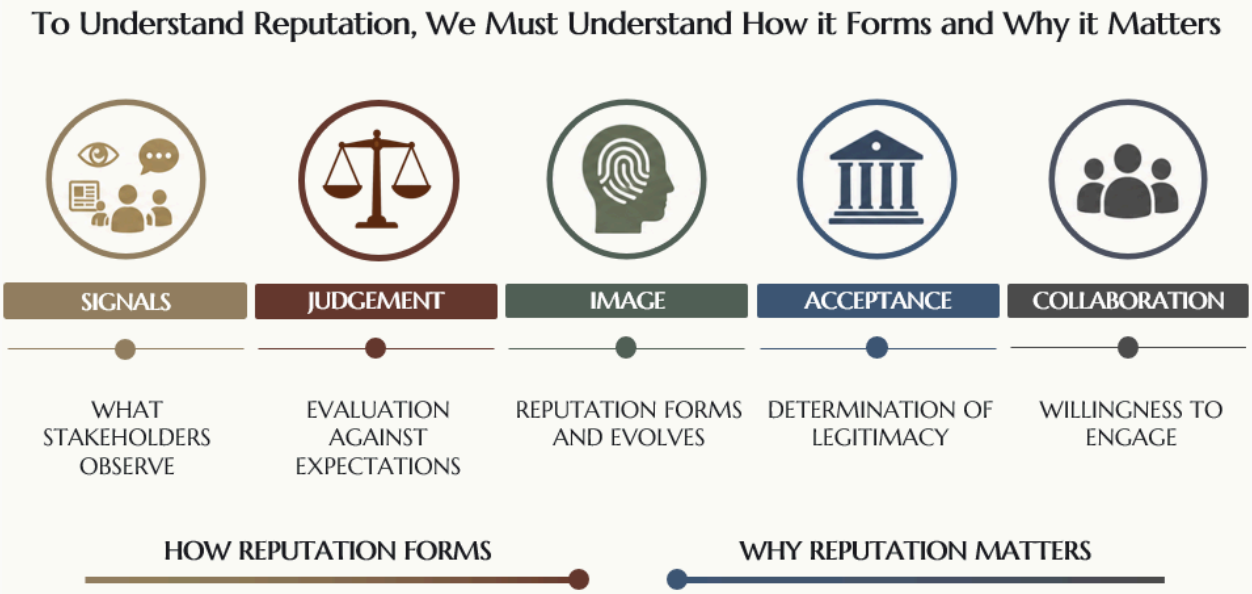
Starting with the Pieces of How Reputation Actually Works

"Does this actor possess the integrity required to effectively wield the power they have been granted?"

What may surprise most institutional leaders is that this is not a question of the modern era. Nor is it one unique to the corporate world. This question is one of the oldest questions humans have ever asked of themselves and others. Long before written law, markets, or formal institutions, people relied on observable signals to judge whether others were predictable, reliable, and safe to collaborate with. The ability to interpret these signals did more than improve individual survival. It enabled cooperation at increasingly larger scales, laying the foundation for families, tribes, markets, governments, and eventually civilization itself. These integrity judgments were integral to determining who would be welcomed, trusted, followed, punished, or excluded. Overtime these judgments would form moral standards for social interactions, eventually hardening into laws and governance institutions to ensure stability, predictability, and reliability. Reputation would emerge from this process, not as an abstract perception, but as a practical system for determining the legitimacy of people and institutions in society. Those that maintained a positive reputation would

DOWNLOAD THE BOOK PROPOSAL

earn acceptance and collaboration, while those that did not would have their legitimacy revoked leading to constraints and withdrawal.



Although the contexts have changed dramatically, the underlying mechanism has not. Modern institutions are evaluated through the same fundamental process that once governed cooperation between individuals. Only the scale has changed. The next three chapters reconstruct the reputation operating system from its foundations. They begin with the moral codes and reciprocal expectations that made collaboration possible, then examine how signals are compressed into durable judgments before separating reputation from the brand systems with which it later became intertwined. The architecture ultimately becomes more sophisticated than this initial model suggests, but its central logic is remarkably simple.

DOWNLOAD THE BOOK PROPOSAL

Chapter 4: How Reputation Forged Civilization

Passage 13: Predictable and Reliable, Not Good and Bad

Summary Text (Not Included in Final Copy): In Reputational risk does not arise solely from visible harm or operational failure. Moral systems evolved not as philosophical abstractions but as practical infrastructure to solve the defection problem and enable collaboration at scale. When societies grew beyond direct observation, integrity emerged as the mechanism that makes moral expectations legible and enforceable through signals of predictability and reliability. The same trust structures that enabled civilization also created opportunities for sophisticated exploitation, forcing groups to develop cheater detection and formalized punishment systems. Understanding reputation requires recognizing that moral judgment compresses a functional assessment of whether an actor is safe to collaborate with, predictable in their conduct, and reliable under pressure.

Questioning whether someone possesses the integrity to manage the power in their remit is not only one of the first mechanics that defines what is meant to be human. It is a core factor in Darwinian evolution[225]. Whether an institution merits the trust it

DOWNLOAD THE BOOK PROPOSAL

needs to operate sustainably at scale can only be answered by examining one deeper layer, the architecture upon which institutional judgment itself is built. For reputation to emerge it will take more than declarations of intent or carefully managed communications. It will emerge when lived experience shows a consistent alignment of accountable behaviors that match with stakeholder expectations. Integrity flows from this alignment, just below the surface of an institution's reputation. Like the foundation beneath a cathedral's stone, it is a foundation that showcases predictability and reliability. Humans constantly seek integrity, as predictability and reliability reduce risk and incentivize collaboration.[226] It enables trust in power structures, for as long as tribes to complex societies have existed.[227] The judgment and evaluation of integrity has taken a moral approach, which enabled coordination mechanisms, evolved over millennia to solve the fundamental problem that has always faced human groups.[228]

Moral systems exist in every civilization, operating less like a philosophical abstraction and more like an evolutionary operating system for collective coordination.[229] Morality is deeper than a simple assessment of good and bad because, at its core,

DOWNLOAD THE BOOK PROPOSAL

morality evolved as a coordination mechanism for human survival.[230] "Good" and "bad" are simple surface terms that express a much deeper and complex system.[231] Beneath these terms sits a much more functional architecture concerned with predictability, reliability, trust, obligation, conduct, and social order.

Early human societies, tens of thousands of years ago, faced a fundamental problem. Small groups depended on hunting, protection, child-rearing, and food distribution. Survival required stable collaboration, yet individual incentives constantly pushed toward opportunism.[232] The same systems that built cooperation were also vulnerable to free riders.[233] A hunter could hoard meat, extract more than their share, or abandon the group in times of need. Groups that successfully maintained reciprocal collaboration were more likely to endure and prosper than those unable to control defection.[234] Moral codes were not invented by philosophers. They emerged across early human communities as a practical solution to the defection problem and the

necessity of reciprocal trust.[235] Moral codes evolved further because humans with strong moral norms outcompeted those without them. The evolutionary embedding of moral behavior became one of the defining characteristics separating surviving from extinct societies.[236]

Moral systems function as operational signaling mechanisms. Honesty, fairness, care, accountability, and commitment signal that another person is predictable and reliable, which makes long-term collaboration possible even when immediate self-interest would incentivize defection.[237] Behaviors that increased reciprocity became labeled as "good" because they improved the group's capacity to function and survive.[238] Behaviors that introduced danger, unpredictability, or exploitation became labeled as "bad" because they threatened collective survival.[239] The function and purpose of morals came first, the labels came later. When people call someone or an institution

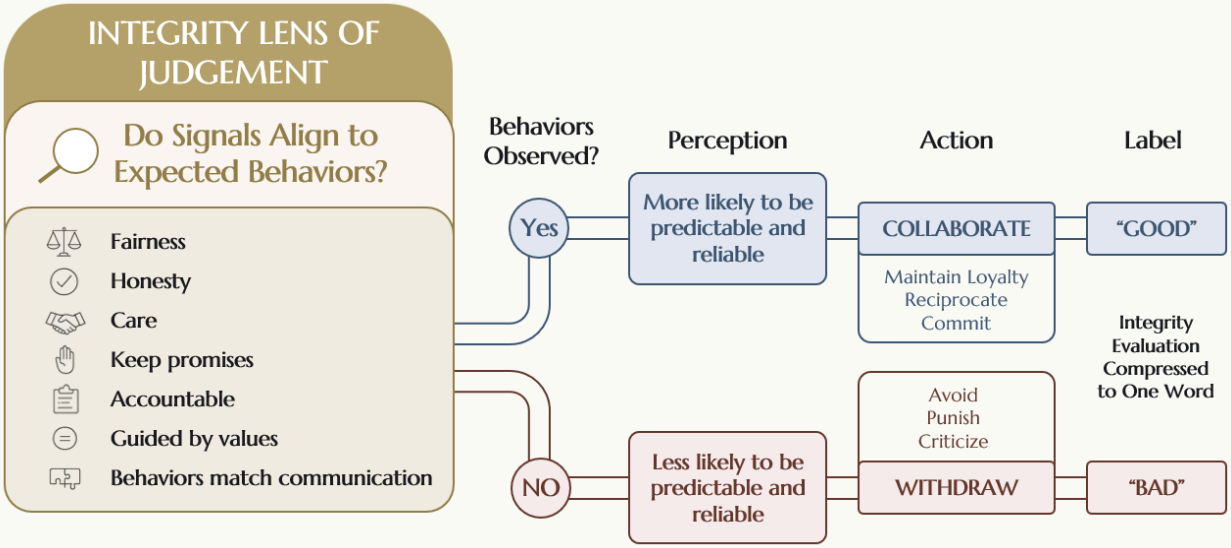
"good" or "bad," they are compressing social signals into a single judgment about whether that actor is safe to collaborate with.



Moral codes reduce uncertainty by establishing shared expectations about acceptable conduct.[240] When individuals know how others are likely to act, the risk of collaborating with them becomes less costly.[241] As trust increases, the risk of betrayal decreases. Predictability allows faster decision-making and more efficient coordination. Under pressure, especially during scarcity or conflict, this predictability becomes essential. A group confident its members will uphold obligations in challenging times coordinates faster and more effectively. A group derailed by

internal distrust moves toward safeguarding, withholding intentions, and waiting for others to act first.[242] When groups faced instability in their social systems, it only further entrenched the importance of instilling moral codes to secure collective, collaborative action to ensure survival.[243]

Large-scale civilizations would only become possible when moral expectations extended beyond kinship (bloodline) networks.[244] Shared ethical frameworks, such as religious systems and cultural norms, allowed strangers to collaborate in trade, governance, and social organization.[245] A merchant in Baghdad could conduct business with a merchant in Venice because both operated within shared moral and commercial norms that transcended geography and blood relations. Moral alignment reduced friction between strangers and stabilized expectations across distance. But this expansion of moral systems revealed a fundamental constraint. Direct observation of moral behavior works in small groups where everyone knows everyone else, which

makes reliability and predictability highly visible.[246] But as societies scaled beyond the natural limits of what a person could observe, something fundamental had to change. The moral systems that governed fifty people could not govern five hundred. The systems created to ensure stability at five hundred could not work for five thousand. What was one established from direct observation had to be created by something else. That something else is integrity, a mechanism that relies on heuristics to make morality legible and enforceable at scale.

But scaling moral systems to encompass strangers and distance also created new vulnerabilities. When observation becomes impossible, so does detection of cheating.[247] Moral systems solved the collaboration problem, but they simultaneously created the possibility of exploitation at a scale that previously did not exist. Evolutionary game theorists identified this tension through a thought experiment called the Prisoner's Dilemma.[248] Game theory emerged in the mid-twentieth century as a mathematical framework for understanding strategic interaction, how individuals

make decisions when their outcomes depend not just on their own choices but on the choices of others.[249] The Prisoner's Dilemma became one of the earliest and most fundamental models in this field because it captures a paradox that appears everywhere cooperation is required.[250] Two hunters are better off hunting together than alone. But each hunter has an incentive to take the kill and flee, leaving the other empty-handed. If both defect, both suffer. If one cooperates while the other defects, the defector thrives and the cooperator starves. Yet groups that developed strong norms against defection and harsh punishments for cheaters survived and expanded.

Once humans established collaborative environments through reciprocal obligation, they also created opportunities for individuals to benefit from the cooperative system without fully contributing to it.[251] A person could gain the protection of the tribe without taking equal risks, consume shared resources without proportional sacrifice, or signal loyalty while acting opportunistically in private. In this sense, the morality

code system that produced stability also produced cheating as an unintended byproduct. The same trust structures enabling humans to advance civilization also created incentives to manipulate trust for personal advantage.

To prevent total collapse humans would develop a strong sense for cheater detection and rules that would be enforced against them once detected.[252] Humans evolved sophisticated cognitive capacities for remembering who cooperated and who deceived, enabling them to make better decisions about future cooperation.[253] To protect others in the group they should share these stories, this is why humans have a deep connection with gossiping, sharing stories of "good" and "bad".[254] Human groups evolved a sophisticated capacity for punishing defectors.[255] Informal punishment mechanisms emerged first where they would be excluded from hunts, denied resource access, and shamed through public stories of their defection.[256] Over time, as

groups scaled beyond kinship networks, informal punishment became unreliable. Anthropologist Robin Dunbar argued that the human brain can maintain approximately 150 stable social relationships, a cognitive limit that constrained how people monitored one another's behavior through repeated interaction.[257] Beyond that threshold, direct observation became increasingly impractical, forcing societies to rely on indirect signals, reputation, and shared norms. A person shamed in one village could simply move to another. But even within a village of 150, informal mechanisms began to strain. So groups formalized their enforcement systems. Punishment became codified into ritual, religious doctrine, and eventually written law.[258] Morality became the language that justified punishment while also internalizing obligation. Shame, guilt, admiration, and honor became emotional enforcement mechanisms that often preceded any institutional system.

Establishing and enforcing a code did more than create social stability, it created evolving emotional triggers. The Scottish moral philosopher Adam Smith grasped this problem in the eighteenth century. Smith argued that moral codes persist because humans possess an innate capacity for sympathy, an ability to imaginatively inhabit

another's situation and feel what they feel.[259] We behave the way we do partly out of fear of letting others down, of failing to meet the expectations we imagine they hold for us. Through this mechanism of sympathy and social fear, abstract social expectations become internal imperatives. When humans sense a moral violation it triggers genuine emotional distress, not mere rational calculation.

This reinforces moral frameworks as a deeply rooted human emotional system. Moral judgment is often driven by rapid emotional processes, making moral emotions powerful enforcement mechanisms.[260] Feelings of shame, guilt, indignation, admiration, and empathy arose because they reinforced collaborative norms quickly, especially under stress.[261] These emotions played a key role in turning abstract social expectations into internal rule frameworks, making moral codes feel natural rather than arbitrary. Over time, these informal emotional systems became formalized into written law, religious doctrine, and cultural practice. Societies emotional signals and institutional backing ensured society maintained stability at scale.[262]

Passage 14: The Second Corridor of Reputational Risk

Summary Text (Not Included in Final Copy): Reputational risk, commonly seen as sporadic, circumstantial, and reactive, always follows a clear pattern. Drawing on Jonathan Haidt's research into five universal moral foundations, care, fairness, loyalty, authority, and sanctity, we see how moral expectations have driven institutional change throughout history. From the Magna Carta's shift toward accountable authority to child labor laws reflecting expanded care, institutions have repeatedly faced delegitimization when they failed to adapt to evolving moral interpretation. Modern reputation operates along two distinct corridors. One is triggered by exposure of consequences such as data breaches, supply chain harms, and

DOWNLOAD THE BOOK PROPOSAL

environmental damage. The other is triggered by perception of moral violation, regardless of measurable harm.

As societies formalized their moral enforcement systems, a question emerged. What moral dimensions actually drove human judgment across different cultures and contexts? If morality was universal enough to enable cooperation across strangers, it must have been built on foundations that transcended geography and history. Psychologist Jonathan Haidt and colleagues developed Moral Foundations Theory, which proposes that humans evaluate moral behavior through a set of evolved psychological foundations that appear across cultures. His analysis showed that care, fairness, loyalty, authority, and sanctity appear in vastly different cultures despite differences in geography, history, and belief systems.[263] These foundations represent the underlying cipher of moral judgment itself.

The care moral foundation concerns harm and compassion. It reflects the moral expectation that suffering should be reduced and vulnerability protected. The fairness moral foundation concerns proportionality and justice. It reflects the expectation that resources, punishment, and opportunity are distributed according to consistent principles. The loyalty moral foundation concerns obligation to the group and the

DOWNLOAD THE BOOK PROPOSAL

expectation that members prioritize collective interests and maintain solidarity, especially during conflict or hardship. This foundation naturally produces in-group and out-group dynamics. The authority moral foundation concerns hierarchy and respect for legitimate power. It reflects the moral expectation that leadership is deserved and that order requires deference to those who have earned it. The sanctity moral foundation concerns purity and the transcendent. It reflects the moral expectation that certain things, ranging from places to principles to artifacts to human creation itself, are sacred and should be protected from desecration or contamination.[264]

These moral foundations are useful for understanding how moral frameworks served as a catalyst for major societal shifts throughout history. Pivotal transformations in societal structure typically occurred at points in time where dominant moral expectations reached a breaking threshold, which forced existing systems to adapt.[265] This established morality as a driving force for identifying societal strain and coordinating the institutional structures required to resolve it. History shows this societal pattern taking place repeatedly across all five moral foundations.

The authority foundation governs how legitimacy is conferred and maintained. Early systems justified power through divine right or inherited privilege.[266] Rulers claimed authority because God ordained it or because bloodline determined fitness.[267] But as societies scaled and information traveled, moral expectations began to shift. Subjects questioned if the ruler held obligations to society. The moral foundation moved from "authority is inherent" to "authority is accountable." This shift did not happen overnight. It accumulated through centuries of tension, revolt, and renegotiation. But when it reached critical mass, it restructured political systems. Councils emerged to constrain power and charters established obligations.[268] Constitutions codified the principle that authority must justify itself to those it governs. The transition from divine right to accountable rule was a transition in the moral interpretation of what authority means. Institutions that resisted this shift faced delegitimization and collapse.

England in 1215 reveals this threshold moment. King John asserted broad royal authority grounded in hereditary succession and divine sanction.[269] His decisions need not be justified to anyone. But barons and subjects had begun to interpret his

authority differently. They demanded reciprocal accountability, arguing that power carried obligations to those governed. When King John refused to adapt to this moral shift, he faced a revolt.[270] The resulting Magna Carta codified the new moral interpretation of what legitimate authority required. It asserted that even monarchs were subject to law, that leaders could be held accountable, and that certain protections applied to all subjects.[271] The document was modest in immediate effect. Most clauses were ignored or repealed.[272] But it marked the formal recognition that the moral interpretation of authority had shifted irreversibly. Over subsequent centuries, that moral expectation continued to accumulate and reshape institutions. Constitutional systems emerged and due process protections were established.[273] The principle that legitimate power must justify itself to those it governs became embedded in governance structures across the Western world. The Magna Carta did not cause this transformation. It was the institutional acknowledgment that a moral transformation had already occurred and could no longer be resisted.

But authority is only one dimension through which moral expectations drove institutional change. Loyalty operates differently, with a deeper bond that holds communities together. Early human groups were small and local, so trust operated through direct relationships. But loyalty through religious systems enabled trust to large-scale collaboration. Christianity and Islam institutionalized shared moral codes that extended trust beyond immediate communities.[274] Concepts like honesty, charity, and obligation to others created behavioral consistency across vast geographies.[275] A Christian merchant in Constantinople could trust a Christian merchant in Rome because both operated within the same moral framework. A Muslim trader in Cairo could collaborate with a Muslim trader in Baghdad through shared principles. These systems allowed strangers to cooperate within shared narratives, supporting trade, governance, and social order across empires. Loyalty is a highly portable moral code. It moves from "loyalty to my tribe" to "loyalty to my faith community" to eventually "loyalty to my nation." Each expansion enabled by a moral framework that could scale beyond direct observation.

But loyalty can scale beyond faith as well. The Hanseatic League, a network of merchant guilds spanning Northern Europe from the 12th to 17th centuries,

demonstrated how institutional loyalty could replace kinship entirely.[276] Merchants from Lübeck, Novgorod, Bergen, and London came from different languages, religions, and regions.[277] Despite the lack of shared physical community, they operated within the same codes of conduct, standardized weights and measures, and mutual obligations.[278] A merchant from one city could conduct business with a merchant from another because both swore loyalty to the League's moral framework. They trusted each other not because they shared blood or faith, but because they shared membership in an institution.

Yet institutional loyalty alone cannot sustain collaboration at scale. Institutions require more than reciprocal obligation among members. Ensuring predictability and reliability requires proportionality, constraints on exploitation, and protections for those with the least power within the system. This is where the moral foundation of fairness enters, which focuses on proportionality and justice. For centuries, economic systems normalized child labor because it was profitable and because those with power benefited from the exploitation.[279] Factory owners extracted labor from

children for minimal cost.[280] The system was stable because it served entrenched interests, but as societies became wealthier and more interconnected people increasingly viewed children not as economic contributors first, but as vulnerable individuals deserving protection, education, and development. Reformers, journalists, religious leaders, and labor advocates helped reshape public perception by exposing the physical harm and harsh conditions children faced in factories.[281] Over time, the moral interpretation of legitimate economic behavior changed. What had once been viewed as economically necessary increasingly became seen as socially unacceptable and incompatible with modern ideas of progress and human rights. When the moral expectation reached a threshold, political action and regulation followed. Nations began passing child labor laws in the late nineteenth and early twentieth centuries.[282] Children gained the right to education, protection from dangerous work, and limits on labor hours. The moral foundation of fairness had shifted leaving institutions that resisted in a state of backlash and delegitimization that threatened their ability to operate.

But the moral expectation of fairness extended beyond workplace protection. For centuries, political and economic systems denied women full participation in

governance, property ownership, and economic participation.[283] As societies modernized and education became more widespread, women increasingly demanded recognition of their capacity for civic participation and economic autonomy.[284] Suffragette movements, writings, and organized resistance exposed the contradiction between democratic principles, which evolved from authority-based morals, and systemic exclusion.[285] Women were citizens, workers, and property holders in everything but law and institutional practice. The gap between stated principles and lived reality became impossible to ignore. Reformers and activists exposed the irrationality of denying half the population participation in governance and economic life. Over time, the moral interpretation of legitimate political and economic systems evolved. Nations restructured their political and economic systems. Women gained voting rights, property rights, and workplace protections.[286] The foundation of fairness had shifted again, and institutions that jeopardized equal treatment of employees would quickly come under paralyzing scrutiny.

But equal treatment and proportional distribution does not directly address suffering itself. While fairness asks whether resources are distributed justly, care asks whether

institutions are protecting people from harm. It asks whether suffering is reduced, especially when suffering is profitable. Many institutional systems historically prioritized efficiency and profit over preventing avoidable suffering. Workplace dangers and hazardous conditions were accepted as the cost of production. But as industrial manufacturing intensified and preventable deaths mounted, moral concern for human suffering began to formalize.[287] The Triangle Shirtwaist Factory Fire of 1911 killed 146 workers, mostly young women, trapped in a burning building because owners had locked the exits to prevent theft.[288] The moral outrage was immediate and visceral. Public demand for accountability forced institutions to adapt and workplace safety regulations emerged.[289] It reinforced the need for fire codes and factory inspections as mandatory safeguards. Institutions that resisted worker protections faced friction with employees, boycotts, and potential legal consequences. The care moral foundation transformed business operations, introducing constraints that prioritized the reduction of suffering even when those constraints reduced profit.

But the moral expectation of care extended beyond human suffering. In the early nineteenth century, Martin's Act (1822) became the first major legislation protecting

animals from cruelty. At the time, this was radical. A moral foundation expanded beyond the human body, human creation, and human systems. Reformers argued that suffering itself, not the species experiencing it, was what mattered morally. If institutions could be compelled to prevent human suffering, they could equally be compelled to prevent animal suffering. If cruelty was wrong when inflicted on people, it was equally wrong when inflicted on creatures capable of pain. Over time, this moral logic accumulated, which lead to laws which protected animals from deliberate cruelty. Animal welfare standards in agriculture, protections in research, restrictions on entertainment using animals all reflected a foundation that had shifted to include non-human suffering. The expansion of the care moral foundation transformed what societies considered their moral obligation, introducing constraints that prioritized the reduction of suffering across species boundaries, even when those constraints were inconvenient or costly.

The care moral foundation addresses suffering itself, but not everything people hold as morally contestable is rooted in the prevention of harm. Some things matter because they are deemed inviolable, beyond instrumental use, worthy of protection for their own sake. Sanctity is a moral concern of purity and the sacred. It arose when early human societies confronted constant threats from disease, contamination, and environmental uncertainty.[290] As a result many cultures developed moral systems

[290] Douglas, M. (2005). *Purity and danger: An analysis of concept of pollution and taboo*. Routledge.

DOWNLOAD THE BOOK PROPOSAL

centered around purity and pollution which governed food preparation, body cleanliness, waste handling, and other rituals.[291] Dietary restrictions reduced exposure to contaminated meat and burial rituals contained disease.[292] Long before the germ theory of disease existed societies had encoded behaviors that protect into moral language, which made sanctity-based morals emotionally powerful.[293] People would follow sacred rules even when rational logic proved to contradict the emotional verdict.

Over time, these ideas expanded beyond physical cleanliness into broader concepts of moral purity. Societies developed taboos against corruption, betrayal, and violation of sacred principles. Museums in colonizing empires often claimed artifacts that held a deeper spiritual or historical meaning.[294] These sacred artifacts from indigenous and colonized peoples came under scrutiny. Repatriation movements emerged from the foundation of the sanctity moral foundation, forcing institutions to return what was

sacred, regardless of institutional or financial cost.[295] Within sanctity violations institutions could face profound delegitimization, even in cases where there is no measurable harm.

The moral expectation of sanctity extends beyond symbolism to abundant natural world resources. Take for example indigenous communities that view water as sacred, not as a commodity.[296] When corporations polluted waterways or extracted water for profit, moral outrage erupted through sanctity-based moral violation.[297] It wasn't a moral care for the environment, it was a violation of the sacred. Sanctity morals create rules and moral frameworks that differ by culture. Consider the Ganges River in India which was formally declared a living entity with legal rights because of its sacred status to Hindu communities.[298] Or the Te Awa Tupuranga Act that granted legal personhood to rivers in New Zealand.[299] These legal shifts meant institutions could no longer treat water as mere property or resource. The expansion of Sanctity

transformed how societies governed their relationship with the natural world, introducing constraints that prioritized the protection of what was sacred over what was profitable.

Up to this point, reputational risk has been anchored around scale and scrutiny. As companies grow, they create blind or hidden consequences. When visibility arrives and attribution occurs, institutions face delegitimizing scrutiny, which often triggers reputational crisis. The modern reputation environment is largely shaped by the exposure of externalities that were once distant, invisible, or absorbed elsewhere. However, consequence born from scale and scrutiny is not the only source of reputational risk. Reputational strain emerges along two distinct corridors. The first is chronic, accumulating through externalities like environmental damage, labor violations, data breaches, and supply chain harms, to name a few. These are failures of consequence management. The second is sporadic, triggered not by measurable harm but by perceived moral violation. Damage to reputation does not require an environmental disaster or a labor dispute. It requires only the interpretation that an institution has violated a moral expectation across care, fairness, loyalty, authority, or sanctity.

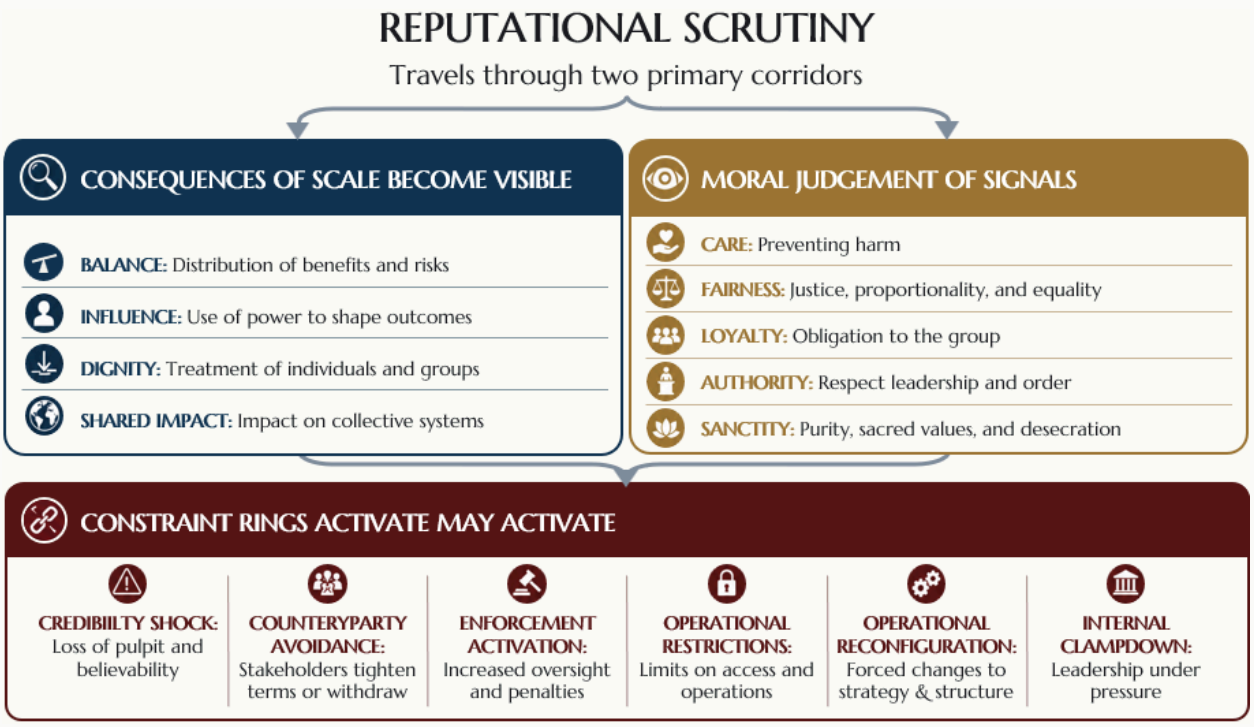
DOWNLOAD THE BOOK PROPOSAL

This distinction matters because institutions often misread their reputation as reactive or unpredictable. In fact, reputation couldn't be anything further from chaotic and unpredictable. Reputation is a system of moral interpretation that translates institutional signals into judgments of alignment (good) or breach (bad). When signals align with stakeholder moral frameworks, collaboration strengthens. When signals breach those frameworks, distancing and punishment follow. The reputation operating system itself is highly consistent and tightly bound; but the interpretation across stakeholders, cultures, and periods of time diverges.

The velocity gaps of recent centuries made consequences of institutional scale visible, triggering a new world for institutions, the Reputation Era. But visibility of consequential harm and negative externalities is only half the story. Companies are now judged by not only on what they do, but also by the signals stakeholders pick up from stories and other observable indicators. In a fragmented information environment, a signal can be read through multiple moral foundations simultaneously. What signals loyalty to one group may signal betrayal to another. What appears fair to one stakeholder may appear as a sanctity violation to another.

DOWNLOAD THE BOOK PROPOSAL

This interpretive fragmentation means reputational risk now travels down two corridors. The first corridor is scrutiny born from exposure, when consequences of scale become visible and are attributed to the institution. The second is scrutiny born from signal interpretation, when stakeholders perceive moral misalignment, regardless of whether measurable consequential harm exists. All threats to institutional legitimacy travel down one of these two paths. Understanding which corridor a reputation risk is originating from is the difference between responding with accountability for perceived consequences or managing behaviors that were misaligned to stakeholder expectations.



DOWNLOAD THE BOOK PROPOSAL

Passage 15: Judging Institutions Through Ancient Human Codes

Summary Text (Not Included in Final Copy): Institutions increasingly face legitimacy strain when stakeholder perceptions of moral misalignment emerge faster than the institution can adapt, a gap between moral expectation and institutional capability. Across five moral domains (Loyalty, Fairness, Care, Authority, and Sanctity), institutions can execute sound business decisions yet trigger delegitimization by violating deep expectations about predictability, proportionality, vulnerability protection, democratic constraint, and human dignity. Integrity is the condition in which an institution's behavior, incentives, governance, and stated values remain sufficiently aligned that stakeholders perceive it as reliable and worthy of trust. When this alignment fractures, stakeholders grant no benefit of the doubt; legitimacy collapses not because of messaging failure but because the institution has signaled through repeated action that its interests and stated commitments have diverged.

Understanding institutional backlash that originates from a lack of moral alignment requires looking beyond modern institutions to the evolutionary foundations of collaboration. Long before the modern day corporation, political, or legal systems existed, human survival depended on the ability to evaluate cooperative predictability

DOWNLOAD THE BOOK PROPOSAL

and reliability in others.[300] While institutions could evolve in remarkable speeds over the period of centuries, the timeline of human collaboration long predates the first Roman university.[301] This means that humans are instinctively ingrained to interpret signals of the world through moral lenses.[302] It serves as the means of identifying who would reciprocate, who might exploit, and who posed risk to collective stability. As a result people have a keen sense for detecting moral heuristics that signal fairness, harm, betrayal, corruption, abuse of power, loyalty, reciprocity, and accountability.[303] What most modern institutions fail to recognize is that they are the new entrant to an ancient system of moral codes, a condition they must operate within for their own survival.

As a result, institutions are not judged purely through rational performance metrics. They are also morally interpreted. It also means that a company does not need to commit overt wrongdoing for its legitimacy to come under pressure. Instead this stakeholder pressure can evolve as institutional behavior appears to become less reliable and predictable. These judgments to assess a company's integrity often occur

DOWNLOAD THE BOOK PROPOSAL

instinctively and emotionally. This helps explain why modern reputation volatility extends far beyond operational performance or legal compliance. Institutions increasingly operate inside systems where public legitimacy is shaped not only by the prosperity they create, but also by whether stakeholders perceive corporate behavior as aligned with deeply embedded expectations. With this lens, ethics becomes less a question of kindness or virtue alone and more a mechanism of societal operability. Reputation functions as the interpretive layer through which stakeholders determine whether an institution is worthy of collaboration.

Institutions operating in the modern reputation environment face a particular vulnerability. They can execute sound business decisions, maintain legal compliance, and generate shareholder returns, yet still face intense scrutiny if stakeholders perceive moral misalignment. The problem is not that institutions are doing illegal things. The problem is that moral expectations operate faster than institutional adaptation. A company can be structurally sound and reputationally destabilized simultaneously. This happens because stakeholders interpret institutional behavior through moral lenses that evolved over millennia, while institutions themselves often operate through economic and legal frameworks designed over decades.[304] The

speed mismatch creates openings for moral violation to emerge even when no law is broken and no harm is measurable in traditional terms. When an institution's decision appears to violate deep moral expectations about loyalty, fairness, or reciprocal obligation, scrutiny follows regardless of economic rationale.

Layoffs themselves create friction along the loyalty-based moral foundation. When executed without respect for reciprocal obligation, they can rapidly destabilize institutional legitimacy. Consider the acquisition of Twitter on October 27, 2022, within days Elon Musk initiated mass layoffs affecting approximately half the company's workforce.[305] The layoffs began on November 1, with approximately 3,700 of 7,500 employees terminated or locked out of company systems without the 60-day advance notice required by federal and California WARN Acts.[306] [307] Employees were instructed to stay home on Friday and wait for an email notification

about their employment status.[308] Some learned their fate by being locked out of their email and Slack accounts before receiving formal termination letters.[309] Days before the layoffs began, Musk had carried a kitchen sink through the Twitter headquarters doors as a visual pun on the phrase "let that sink in."[310] The moment was meant as humor, a signal that dramatic change was coming. But reputationally and culturally, the image became much larger than a joke. The sink would be remembered not as a witty introduction to transformation but as a symbol of loyalty disregarded to the people who had built the company.

The loyalty-based violation emerged not from the layoffs themselves, as corporate downsizing is economically defensible and often necessary. The violation was instead the mechanism of execution and the signal it sent about management's commitment to reciprocal obligation. Musk later tweeted that "everyone exited was offered three

months of severance, which is 50% more than legally required," [311] framing the layoffs as economically generous. Yet the mechanism violated deeper expectations about how institutions treat people during structural change. Without advance warning, any opportunity to plan, and a lack of personal communication the message was decoded as morally unsettling. Employment lawyers called the approach "inhumane," while others noted that Musk's strategy, though legally aggressive, created a paper trail that exposed his broader indifference to labor law compliance across his companies.[312]

The reputational consequence followed predictably from this loyalty breach. Remaining Twitter employees faced an immediate choice. Stay with an organization that had just demonstrated it would terminate half its workforce without notice, or leave voluntarily. When loyalty fractures most will choose to exit if they can, in this case hundreds of Twitter employees choose to leave a firm that they felt violated reciprocal loyalty.[313] This pattern appears consistently across institutional settings. A Harvard Business Review study found that workforce reductions of just 1 percent trigger a 31 percent increase in voluntary turnover in the following year.[314] The institution had signaled that loyalty was not reciprocal, that employees held no protected status during organizational change. For those remaining, the message becomes clear, the institution carries no protective value. An institution's commitment to its people at a difficult crossroad becomes the metric by which stakeholders evaluate whether that institution deserves their continued collaboration.

Unlike the loyalty breach that emerges from mechanism and signal, Fairness violations operate on a different principle. A company can follow supply and demand curves perfectly, comply with every relevant law, and still register as deeply unfair in the court of public perception. Surge pricing demonstrates this distinction with particular clarity. When demand rises and prices rise accordingly, the economics are sound. Yet stakeholders evaluate pricing not through economic rationality alone but through moral intuitions about proportionality, vulnerability, and whether the institution is exploiting circumstances that people cannot escape.[315] The gap between business rationale and moral interpretation is where fairness violations live. An institution can be economically correct and morally illegitimate at the same moment.

Wendy's discovered this in February 2024 when the CEO, Kirk Tanner, announced during an earnings call that the company would invest in digital menu boards capable of "dynamic pricing and day-part offerings" beginning as early as 2025.[316] The announcement was meant for investors, framed as operational capability and revenue optimization. Instead, within hours, national headlines declared that Wendy's would

introduce surge pricing.[317] Social media erupted with #BoycottWendys trending across platforms.[318] Competitors saw an opportunity and immediately weaponized the moment. Burger King launched a "No urge to surge" promotion.[319] The moral interpretation had crystallized instantly. Customers understood the announcement as permission to charge them more during peak hours when they were hungry and had fewer choices. Wendy's rushed to clarify that it never intended to raise prices at peak demand, only to lower prices during slow traffic.[320] The company issued a damage control statement, announced a monthlong $1 burger deal, and attempted to reframe dynamic pricing as merely a digital tool for menu flexibility.[321] The reality of the case was that Wendy's had never actually tested surge pricing,[322] never charged a single customer more, yet the mere possibility that it might exploit scarcity triggered an

emotional fairness morality breach that delegitimized the business and took months to recover.

Wendy's to introduce surge pricing in 2025[323]

A news clip video covering Wendy's potential dynamic surge pricing strategy.

Delta Air Lines pursued a similar strategy but with a crucial difference. Rather than announcing plans publicly, the company quietly deployed AI-based pricing technology that adjusted fares based on what the algorithm estimated each individual customer would willingly pay.[324] This pricing model leveraged behavioral and market data to estimate a passenger's willingness to pay, allowing fares to shift dynamically at scale.[325] The system continued expanding even after public scrutiny intensified, reflecting a

broader institutional push toward AI-assisted optimization across the airline industry.[326] Consumer advocates and lawmakers responded swiftly once the practice entered public debate. Democratic Senator Ruben Gallego called it "predatory pricing," accusing Delta of using AI to "find your pain point" and "squeeze you for every penny."[327] Two Senators, Edward Markey and Richard Blumenthal, sent letters warning ten U.S. airlines.[328] Consumer experts explained that while no law explicitly prohibited the practice, the fairness of pricing was in question.[329] If two people buying the same seat paid different prices based solely on the system's prediction of their willingness to pay, that relationship violates the ability for the company to claim it treats customers fairly.

Care as a moral foundation operates at a different register from loyalty or fairness. A care-based moral violation does not emerge from broken reciprocity or proportionality. It emerges when an institution's actions, or inactions, enable preventable suffering among vulnerable populations. Care is the most visceral of the moral foundations because it is rooted in the fundamental human capacity to recognize suffering and feel an obligation to reduce it. When institutions are perceived as amplifying suffering, especially suffering of vulnerable groups of people, the violation registers not as a policy disagreement but as a moral breach. Panic buying can provide a gateway to institutional delegitimization. Consider the COVID-19 induced panic buying of toilet paper in 2020.[330] The shortage itself was an accident of supply chain dynamics, but the price spikes that followed were not.[331] Choices to extract maximum revenue from scarcity while vulnerable populations lacked access to basic sanitation.[332]

DOWNLOAD THE BOOK PROPOSAL

Toilet paper prices spiked an average of 30 percent worldwide, with some retailers experiencing increases exceeding 100 percent.[333] Those who arrived early at stores with cash or access to online platforms secured supplies. Those who arrived late, who lacked transportation, who had limited income, went without. The mechanism follows rational economic principles, but the emotions it triggered were deep because toilet paper is not a luxury good. People see it as a necessity for basic human health and dignity, leaving vulnerable populations unable to meet their most fundamental sanitation needs. The violation also triggered a sense of cheating as secondary market resellers, price gouging, and the visible hoarding captured on social media.[334] Low-income families, older adults, immunocompromised individuals, and those without reliable internet access or transportation often faced greater difficulty accessing essential goods and healthcare during the shortages.[335] As shortages endured the care-base morality violations multiplied as armed robberies occurred in Hong Kong when knife-wielding men stole hundreds of rolls from a delivery truck.[336]

Care-based violations emerge when institutions enable or do nothing to prevent harm among the vulnerable, but authority-based moral violations operate through concerns of power and jurisdiction. Authority violations lean into where influence is centered, the duty of those in subordinate positions within the group, and an evaluation of how power is leveraged as an obligation to those they govern. Authority violations typically emerge when accountability is circumvented, which undermines obligations to others in the group. The pharmaceutical industry's response to drug price negotiation reform provides an example of power that can be exposed to potential delegitimization through the authority-based moral domain. Americans continue to face rising prescription drug costs, which has led to patients rationing insulin.[339] In some cases essential medications have become financially inaccessible, which has crystallized public concerns into clear political demand.[340] Eighty-three percent of Americans support allowing Medicare to negotiate drug prices. That support exists across party lines, with ninety-five percent of Democrats supporting it and seventy-one percent of Republicans.[341] The democratic signal is unambiguous, yet

the pharmaceutical industry responds not by conceding to public preference but by deploying institutional power to resist it.

In 2022, a total of $4.1 billion dollars were spent lobbying Congress and other federal agencies.[342] The pharmaceutical and health industry ranked as the highest in lobbying spend at $380 million, outspending every other industry sector.[343] The majority of this spending targeted the Inflation Reduction Act, legislation that would allow Medicare to negotiate prices on certain prescription drugs, cap out-of-pocket spending for beneficiaries, and address insulin costs.[344] This scale of this effort was among the greatest efforts ever taken to lobby Congress and federal industries. Yet despite the resources deployed, the pharmaceutical industry lost and the bill passed. The Authority violation in this case was not the outcome, it was the relationship between money and governance. Pharmaceutical companies and their political action committees made campaign contributions to numerous lawmakers who later opposed Medicare drug price negotiation legislation. For many observers, the close timing of

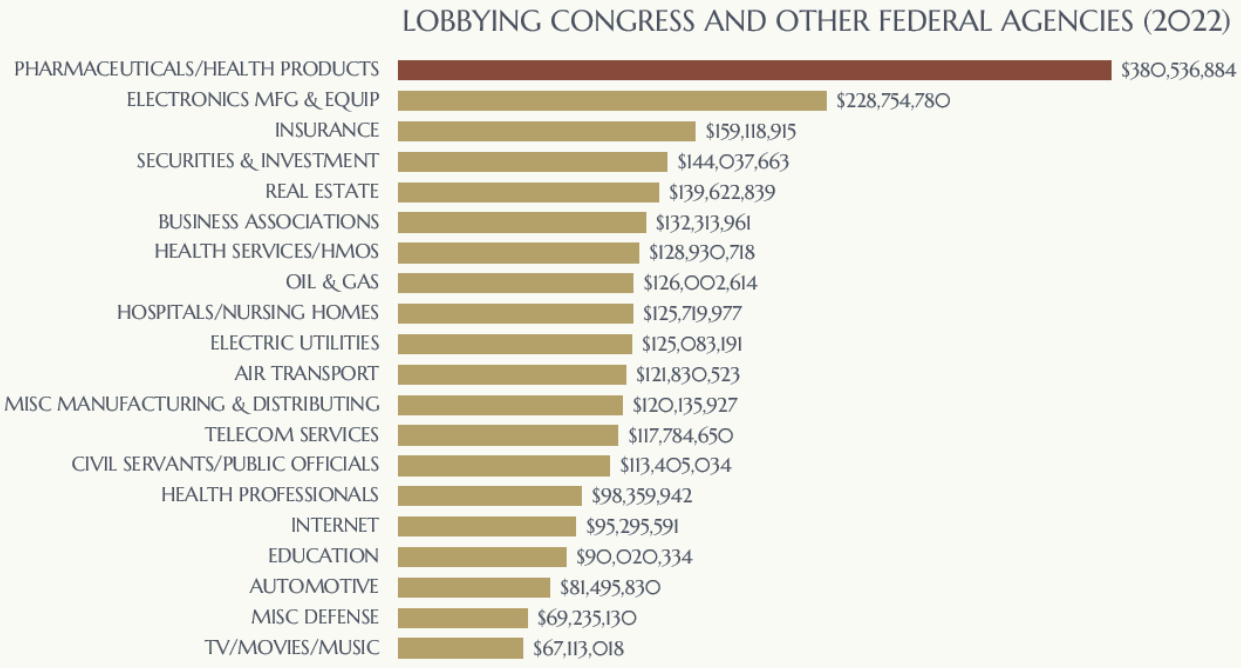
campaign contributions and legislative opposition created the appearance of a transactional relationship.[345] For many stakeholders, that relationship between financial influence and legislative position was itself an authority-based violation, regardless of the final vote.



Lobbying Data Summary. (n.d.). OpenSecrets. Retrieved May 21, 2026, from https://www.opensecrets.org/federal-lobbying

This authority-based violation only deepens. After the legislation passed, rather than accept democratic defeat, the pharmaceutical industry shifted strategy to post-passage lobbying targeting regulatory implementation. After Congress enacted

[345] Dunleavy, K. (2021, October 26). *Democrats opposed to drug price reform are among those who received the most in donations from the pharma industry: Report | Fierce Pharma*. https://www.fiercepharma.com/pharma/democrats-opposed-to-drug-price-reform-are-among-those-who-have-received-most-donations-from

Medicare drug price negotiations, the industry continued its efforts through extensive lobbying campaigns, including 545 unique lobbyist-client relationships in 2025 aimed at weakening the program's negotiation authority. More than 90 percent of those relationships sought to weaken, narrow, or delay the new negotiation authority. Opposition outnumbered support by a ratio of 20 to one.[346] The pattern revealed institutional logic acting to circumvent democratic outcomes through regulatory and legislative pathways. Stakeholders interpret it as an institution using leverage and complexity to work around rather than accept the democratic will. When institutional power is deployed persistently in service profit over democratic governance, the company risks having its own authoritative voice and influence delegitimized.

While authority-based violations concentrated on the legitimacy of institutional power, sanctity-based violations revolve around the intangible, symbolic, and sometimes spiritual. Sanctity is about what people hold sacred, inviolable, and protected from instrumental use. It asks whether certain things, innate or ethereal, can be protected for its own sake, as opposed to being exploited to earn a profit. The rise of generative AI in creative industries triggered sanctity-based violations across multiple domains because AI systems fundamentally reframe creativity from a sacred

human capacity into a replicable algorithmic process. In May 2023, approximately 11,500 members of the Writers Guild of America went on strike after studios refused to bargain over artificial intelligence protections.[347] The strike lasted five months through a record heat wave.[348] Writers picketed not over compensation alone but over what one described as an existential threat to their craft. One writer recalled, "It's scary. We were watching in real time how it was starting to generate ideas, storylines, and scenes."[349] The studios' refusal to even bargain signaled something larger than a negotiating position, it signaled that AI generated copy of human creativity was acceptable. The sanctity-based moral violation was not in the technology itself. It was in the institutional refusal to acknowledge that human authorship held any special status worth protecting.

What emerged from the five month strike was not primarily a technical victory but a moral affirmation. Writers had named something essential about their work that

DOWNLOAD THE BOOK PROPOSAL

studios initially refused to recognize. They were fighting not for higher wages or better benefits, they were fighting for the principle that human creativity is sacred, that the act of writing stories, shaping culture, generating original ideas is a human capacity that should not be rendered algorithmically. Actor Bryan Cranston positioned AI as "literally dehumanizing the workforce," adding that "It's not good for society. It's not good for our environment. It's not good for working-class families."[350] The studios' initial refusal to bargain over AI had sent a signal that was morally devastating. The interpreted signal was that a human creative spark was just code that machines could begin to replace. The strike was an act of resistance against that reduction.

The Drake deepfake case illustrated a sanctity-based violation in a more intimate manner. In April 2023, an anonymous TikTok user named Ghostwriter released a song titled "Heart on My Sleeve" featuring AI generated vocals that perfectly mimicked Drake and The Weeknd.[351] Neither artist authorized the song nor had they even

created it.[352] Yet the track amassed over 250,000 Spotify streams and 10 million TikTok views within two weeks before being removed from platforms.[353] The violation was more than copyright, it was identity theft. Drake's voice, his singular and irreplaceable vocal frequency, had been stolen and repurposed. The identity of a human being had been commodified into code. Drake called it "the final straw AI.".[354] The phrase captured the sanctity violation. That violation of self, of the artist's singular identity, registered differently than economic competition or copyright infringement, it registered as desecration.

Signals that Weakened Institutional Integrity

	Primary Moral Foundation	Why Stakeholders Perceived a Moral Violation
Twitter (X) Layoffs	Loyalty	Reciprocal obligation and commitment to employees appeared to be quickly and unexpectedly abandoned.
Wendy's Dynamic Pricing	Fairness	The possibility of charging more during peak periods was interpreted as exploitation rather than value creation.
Delta AI Pricing	Fairness	Individualized pricing challenged expectations of equal treatment and proportionality.
COVID Toilet Paper Shortages	Care	Profit maximization during a public health crisis challenged vulnerable populations.
Pharmaceutical Lobbying	Authority	Institutional influence appeared to circumvent democratic expectations and public accountability.
Writers Guild of America (AI)	Sanctity	Human creativity was reduced to an algorithmic commodity.
Drake AI Deepfake	Sanctity	A person's unique identity and creative expression were appropriated without consent.

These case studies serve as a reminder that reputational risk emerges along two distinct corridors, each threatening to delegitimize companies in the the Reputation Era. The first corridor is scrutiny born from exposure, when consequences of institutional scale become visible and are attributed to the organization. Societal harms such as supply chain labor violations, market controls, and environmental disasters, to name a few, were once invisible, either because the world was blind to them, or because they were intentionally hidden. In the Reputation Era modern technologies and information systems have rendered them visible. The second corridor is scrutiny born from signal interpretation, when stakeholders perceive moral misalignment regardless of whether or not measurable harm exists. In these cases, a

company need never charge surge pricing to face delegitimization just for planning to do so. In this corridor stakeholders can trigger defection if the perception of cheating and betrayal arrives first.

This distinction matters because it explains an institutional blind spot that defines the modern reputation environment. Companies tend to execute decisions through incentive and legal frameworks, assessing profitable execution "within the rules of the game", per Milton Friedman's shareholder primacy guidelines.[355] Stakeholders, by contrast, evaluate the decisions of institutions through moral heuristics evolved over millennia to solve for group coordination and stability at scale. When direct observation is impossible and institutions grow beyond what any single person can understand intimately, moral heuristics become a substitute for direct knowledge. It serves as a conduit that stakeholders use to determine whether an institution is safe to collaborate with, predictable in its conduct, and reliable under pressure. This structural mismatch creates blind spots where institutions believe they are operating soundly while stakeholders are perceiving moral violation. An institution's efficiency meets questions of fairness. Legal compliance is decoded through the lens of loyalty

[355] Friedman, M. (2007). The Social Responsibility of Business Is to Increase Its Profits. In W. C. Zimmerli, M. Holzinger, & K. Richter (Eds.), *Corporate Ethics and Corporate Governance* (pp. 173–178). Springer. https://doi.org/10.1007/978-3-540-70818-6_14

and reciprocal obligation. The institution cannot always see what the stakeholder perceives because they are reasoning through different frameworks entirely.

It is critical that institutional leaders understand that morality is not primarily about good versus bad. One of the keys to unlocking reputation is to understand morality as a reciprocal operational system of collaboration that scales or retracts. Humans naturally seek stability, especially when threats to that stability become visible. They reward signals of predictability and reliability with collaboration and trust. Conversely, when they perceive cheating, exploitation, or broken reciprocity, they defect. They withdraw collaboration and attempt to undermine the systems they feel threaten stability and sustainability. This pattern existed thousands of years ago in small hunting bands where survival depended on cooperation and where defection could mean death. Today it exists in the same form, operating through the same ancient heuristics, now directed at institutions instead of individuals. The reason morality carries such weight now is the same reason it carried weight then. Because morality is a judgement system that serves as a means of coordinating collaboration.

The net evaluation of whether stakeholders collaborate is the measure of an institution's integrity; a marker of perceived reliability and predictability. When

DOWNLOAD THE BOOK PROPOSAL

stakeholders observe alignment across behavior, incentives, governance, and stated values, they perceive the institution as reliable and predictable, even under pressure. They can sense that the organization's interests and commitments have remained consistently integrated over time. But stakeholders are also hard-wired for detecting cheating as well, quickly identifying say-do gaps. Which happens when they perceive fragmentation between what the organization says it values and what it actually prioritizes, when incentive structures diverge from stated purpose, when governance systems fail to constrain abuse of power, stakeholders' defect and collaboration withdraws. This is why modern institutions fail when reputation is anchored in messaging alone. The focus on communications alone cannot fully account for how stakeholders assess reputation through the lens of incentive structures, governance capacity, behavioral coherence, and the relationship between stated values and demonstrated priorities.

Modern reputational crises are better understood when they are decoded as perceived moral violations because this framework reflects a system humans have relied upon not only for judgment, but to forge civilization. When layoffs happen without notice, stakeholders read a violation of loyalty and reciprocal obligation. When pricing strategies exploit scarcity and vulnerability, stakeholders read a violation of fairness and care. When institutional power works around democratic will,

DOWNLOAD THE BOOK PROPOSAL

stakeholders read a violation of legitimate authority. When human creativity is reduced to an algorithmic process, and when sacred things are rendered instrumental, stakeholders read a violation of sanctity. None of these are processed as isolated operational incidents. All are read as signals about whether the institution remains worthy of the collaborative trust it requires to operate at scale. This is how stakeholders morally decode institutional legitimacy. This is the baseline mechanism through which reputation functions as an operating system that either enables or constrains an institution's ability to sustain permission to exist.

This means that unlike a branding campaign, reputation wasn't invented. It did not derive from philosophy or business school academics as a solution for the modern business era. Reputation is a systems infrastructure that has been used for millennia to decide who deserves collaboration, especially when under pressure. It is morally coded, not to judge "good" or "bad", but to create a system where signals are translated into an evaluation of integrity, inferring that someone, or something, is predictable and reliable. When integrity is strong, the response triggers collaboration, when it is weak the likelihood of defection increases.

DOWNLOAD THE BOOK PROPOSAL

This reinforces an untold truth about the Reputation Era. It is a period of time where institutions are no longer judged solely by performance or competence, but by whether stakeholders perceive alignment between communications, behavior, and values assessed against a company's power and obligations. As a company's perceived sense of power and obligation increases, the gap between behaviors, communications and values must narrow or the organization risks being delegitimized. The modern reputational crisis is therefore not simply a communications problem. Reputation is a judgement system that grants acceptance or withdraws engagement. A morals-based system, driven by ancient human instincts, which has collided with technologically and economically accelerated systems of visibility and interpretation. The Reputation Era does not force institutions to display kindness, virtue, or "goodness", what it forces is a structural reconciliation that businesses must shape and align the business to broader, integrity-based, stakeholder expectations.

Chapter 5: Before the Rules Arrive

- Narrative is the earliest human reputation system, where shared stories (gossip)

Passage 16: Spilling the Tea

Summary Text (Not Included in Final Copy): For most of human history, the consequences of reputational compression were naturally constrained. Gossip moved at the speed of conversation. Stories traveled slowly. Labels spread through communities measured in hundreds or thousands of people. Today, the same psychological architecture operates across networks connecting billions. The mechanism did not change. The scale and velocity did. A reputational judgment that once remained local can now become global within hours. This is one reason modern reputation systems appear increasingly unstable. Human cognition evolved for village-sized information environments, not algorithmically amplified ones.

In small communities, reciprocation was a practical necessity. Advancing, and surviving, depended on knowing who could be relied upon and who posed a threat.[356] Most of which was determined by understanding who violated the norms that held groups together. Direct observation was the primary way of obtaining this

[356] Sahlins, M. (1995). *Stone age economics* (9. [pr.]). Aldine de Gruyter.

DOWNLOAD THE BOOK PROPOSAL

knowledge.[357] As communities expanded, direct observation became insufficient. No individual could reliably monitor how everyone adhered to the norms that held the group together.[358] This created the need to assess if someone could be trusted to do the right thing, even if you could not personally validate their reliability and predictability.

Assessing integrity was difficult and uncertain. To reduce uncertainty people relied on gossipping as a tool to derisk collaboration.[359] As a result, the most valued and viral gossip focused on character assessment. It informed others about who was selfish, treacherous, reckless, loyal, or generous creating reputational intelligence. When it was learned that another had cheated in a trade, violated a promise, or acted violently that knowledge itself became the incentive to retell it, so it could protect the group. In many communities, failing to share information about untrustworthy behavior could be interpreted as disloyal or irresponsible.[360] Conversely, sharing gossip

DOWNLOAD THE BOOK PROPOSAL

boosted someone's social value.[361] This made gossip a self-reinforcing construct, a low cost, high velocity, information system which enables groups to monitor behavior and maintain collaboration.

A loss of character through gossip had significant consequences that typically focused on exclusion.[362] The threat of becoming the subject of gossip created powerful incentive structures to conform to social norms and codes.[363] Conformity became rational not because of written law, but because the cost of reputation damage was immediate with material impact, often long before the rules arrived. In this sense reputation has always served as a structure of governance, regulating how groups collaborated before formal institutions existed.

As societies expanded, gossip alone became insufficient, but the underlying function it served would remain the same. Trade gradually extended beyond towns into regions and nations, while institutions accumulated power and became increasingly distant

from direct observation and accountability.[364] In response, gossip transformed into structured narratives capable of traveling across distance. Distance didn't mean that people stopped talking, instead they made sure character narratives could be told and retold through story. For stories to travel efficiently, however, they could not remain fully intact. Every retelling favored simplicity over completeness. Context, motive, and nuance were gradually discarded until complex realities became compressed into memorable symbols.[365] Because listeners had little time for nuance, stories naturally evolved toward headlines, labels, heuristics, and identity cues. This is how stories transform through symbolic compression. This symbolic compression is what made reputation portable, allowing it to spread far beyond firsthand observation. When stories became compressed into labels, they became easier to remember, easier to repeat, and more likely to capture attention. Stories that failed to produce memorable symbolic shorthand were less likely to be retold and ultimately did not survive.

DOWNLOAD THE BOOK PROPOSAL

As a result, orality, and communication more broadly, naturally favors efficiency. Sticky phrases were found to be useful labels because they reduced identity into symbols. Not only did they travel faster, but they reinforced the most important points of a long-form narrative. While President Trump offers modern day examples of how labels enable a quick evaluation of identity through his use of “Sleepy Joe Biden”, “Crooked Hillary”,[366] and “Fake News”[367] the use of labels in orality is as ancient as the origin of gossip itself. Consider “swift-footed Achilles”, someone doesn't need to read Homers story, *The Iliad*, to know that Achilles is a nimble person. These compressed communications formats work because they reduce identity into portable, highly memorable, symbols. Repeated epithets such as "swift-footed Achilles" helped oral transmission by making characters easier to remember and recognize.[368] The brain remembers these labels not as careful accurate assessments but as emotional, symbolic anchors.[369]

While the label helps stories go viral, there is a considerable tradeoff. What survives as a quick signal of reputation is rarely the full story, people only get the compressed version. The label "Terrible" association with Ivan gives us the emotional cue, someone that should be feared, avoided, and certainly isn't one that would be thought of as predictable and reliable. Those that hear the label Ivan the Terrible quickly interpret an overall evaluation of his reputation. What is lost, and unknown to many, is how Ivan earned that label. He ruled Russia, expanding his power through brutal means, marked by paranoia and rage.[370] He created the Oprichnina, a terror apparatus that was loyal only to him, with the intended purpose of spreading fear throughout Russia.[371] In the

sack of Novgorod in 1570, his forces massacred thousands.[372] His brutality knew no boundary striking his own son in anger, then holding the body as life drained out of it.[373] Ivan the Terrible's reputation is understood as an emotional symbol. But the nuance of his political calculations, the external pressures he faced, the logic of his decisions, all of it discarded as additional context to a label easily understood.

In modern times, the pattern is identical. Enron did not collapse because of a complex failure in energy markets and accounting standards.[374] It became a label for "corporate greed".[375] Tylenol's tamper proof packaging earned it the label of "safety", one that set industry standards.[376] Trader Joe's quickly becomes understood as "friendly, quirky, quality," less so than deploying robust supply chains and an employee-centric labor model.[377] These reputations have traveled through millions of consumer, academic,

and regulator conversations, but the full architecture of their story is much less well known. What remains is the compressed, emotionally resonant version that the brain can hold and retransmit. Reputation travels through stories, but it often survives as labels.

Compression is not a flaw in human communication, it is an adaptive feature that ensures information transmits across groups.[378] Wired into human nature is the unconscious trimming of detail, accuracy, and precision when sharing information.[379] Society depends on communications that are optimized for transmissibility, even if less accurate. When information travels further, the group has a greater chance for survival, and what triggers emotion travels farthest.[380] While a factual statement, however accurate, is more likely to die off faster than one that has emotional stakes.

DOWNLOAD THE BOOK PROPOSAL

Emotional cues often arrive before deliberate reasoning has time to engage because the brain processes threat, loyalty, betrayal, triumph, shame, power, and injustice before it processes neutral, more rationally detailed, information.[381] This prioritization is also not a bug in communication and cognition, it is another ancient survival mechanism. In environments where missing danger could be lethal, the ability to quickly assess threat mattered more than the ability to carefully evaluate evidence.[382] The brain evolved to notice what triggers emotion first, and to ask questions later, if later ever comes. This makes fear, anger, disgust common emotional reactions that happen fast, often subconsciously.[383] It has the capacity to bypass the rational mind and move straight to behavior.

This speed creates a fundamental asymmetry in reputation formation. People often make reputational judgments with nothing more than a quick image, a facial expression, a tone of voice, or just a few seconds of video.[384] These fragments are

processed through fast emotional systems that evolved to quickly assess whether someone is trustworthy, dangerous, competent, or aligned with your interests. Psychologists call this phenomenon thin slicing, the tendency to form rapid, durable judgments from minimal information.[385] By the time deliberate reasoning engages fully, the emotional categorization has already formed and begun to anchor how subsequent evidence is interpreted. Once established, it is highly sticky. Quick emotional judgments seek evidence after the category has been committed to, and contradicting evidence struggles against the frame already set.[386] This means that once a label has been placed, it resists reclassification. This explains why reputation, once tarnished, is difficult to rebuild, often consuming a great deal of time and resources.

A challenge arises in how information systems exploit this judgement architecture. The media optimizes emotional fragments over the full context of the story.[387] It focuses on the image, the headline, or the out-of-context quote, knowing that the initial judgment will stick, and that later evidence, no matter how substantial, will

struggle against the category already formed. A viral video of an executive's momentary anger becomes "arrogant CEO." A news headline about a customer confrontation becomes "abusive airline." A political statement taken out of context becomes "corrupt politician." The interpretation of the signal happens not through careful analysis but through emotional reaction. This is why reputation can both shift in moments but also take years to change the label.

Few forms of information are more socially powerful than negative narratives.[388] One reason is evolutionary asymmetry. Throughout history, the cost of ignoring potential danger often exceeded the cost of overreacting to a false alarm.[389] A person who dismissed warnings about someone perceived as violent, deceptive, disloyal, or dangerous to the group risked severe social, economic, or even physical consequences. By contrast, someone who overreacted to a rumor typically risked embarrassment, damaged credibility, or wasted energy.

Over time, this imbalance conditioned people to treat negative social information as especially salient. Human attention is generally more sensitive to potential threats

DOWNLOAD THE BOOK PROPOSAL

than to positive or neutral signals because risk avoidance often carried greater survival value than opportunity seeking. Decades later, behavioral economist Daniel Kahneman and his collaborator Amos Tversky formalized a version of this tendency through the concept of loss aversion.[390] In repeated experiments, people consistently reacted more strongly to potential losses than to equivalent gains. For many participants, the pain of losing $100 felt psychologically greater than the satisfaction of gaining the same amount. In some cases, individuals even chose smaller guaranteed gains over larger probabilistic rewards simply to avoid the possibility of loss or uncertainty.

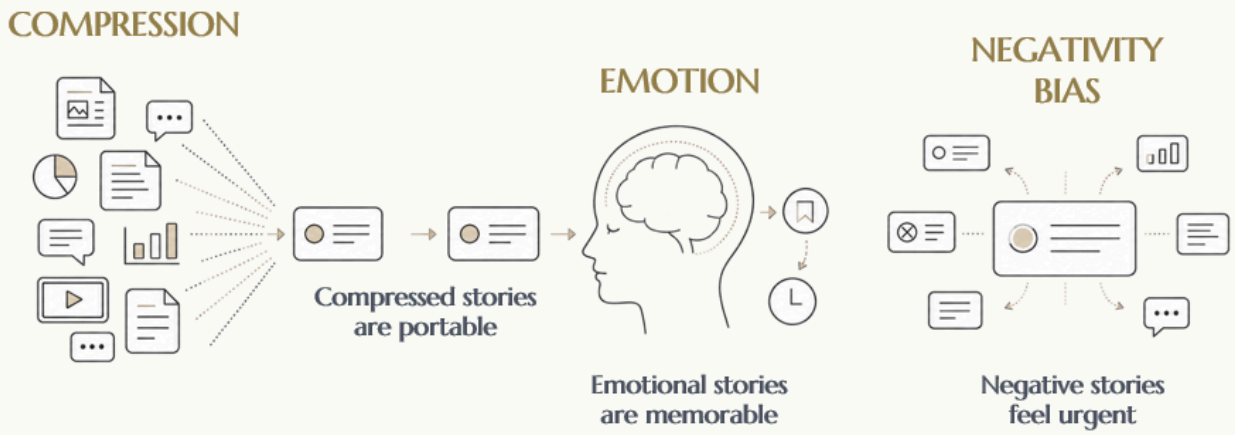
This asymmetry helps explain why communities became more responsive to warnings about danger than to confirmations of stability. Negative stories tend to spread with greater urgency, emotional intensity, and social persistence because they activate systems of social risk detection that humans are predisposed to prioritize.[391] In reputational systems, that tendency carries enormous implications. A single allegation of deception, corruption, disloyalty, or harm can outweigh years of stable behavior because people instinctively give greater weight to information associated with

[390] Kahneman, D., & Tversky, A. (1979). Prospect Theory: An Analysis of Decision under Risk. *Econometrica*, *47*(2), 263. https://doi.org/10.2307/1914185

[391] Tierney, J., & Baumeister, R. F. (2019). *The power of bad: How the negativity effect rules us and how we can rule it*. Penguin Press.

potential danger. It also explains why a single trust failure outweighs signals that build perceptions of integrity, because the cost of misplacing trust feels greater than the benefit of identifying who is the most predictable and reliable.

This creates an asymmetry in how information travels. A warning about who cheated, who stole, who betrayed, who hurt someone spreads because it carries perceived survival value. A story about who is trustworthy or kind still holds value, but is not seen as urgent. That is why outrage, scandal, fear, and moral violation travel faster through gossip, media, and social networks than positive stories typically do. Negative information nearly always wins the information footrace.



This ancient survival mechanism, this negativity bias, did not disappear when humans invented writing, mass media, or global markets. It remained embedded in how reputation forms in the information ecosystem. And in the Reputation Era these systems have been amplified significantly. Social platforms did not introduce negativity

DOWNLOAD THE BOOK PROPOSAL

bias, they industrialized it. These systems reward engagement, and engagement is strongest when content triggers emotion.[392] Algorithms amplified an ancient human condition allowing negative, less accurate, information to travel faster and further than it could have decades ago.[393]

All of this explains a persistent institutional misunderstanding of reputation. The compression, the emotion, the negativity asymmetry all point to the same conclusion that reputation lives and travels through narrative, shaped by the very mechanisms of how humans communicate and form judgments. While this is true, it is also an optical illusion. This view of reputation as narrative, traveling through compressed emotional signals, often leaves institutions with a tendency to treat it as a "communications problem", less so a dedicated business function or an infrastructure that ensures an institution earns the acceptance it needs to operate and grow.

This misleading truth has led to the inevitable and persistent mistake. The assumption most arrive to, is that by controlling the story, one can control reputation. Crafting the right message, deploying it through the right channels, and repeating it with

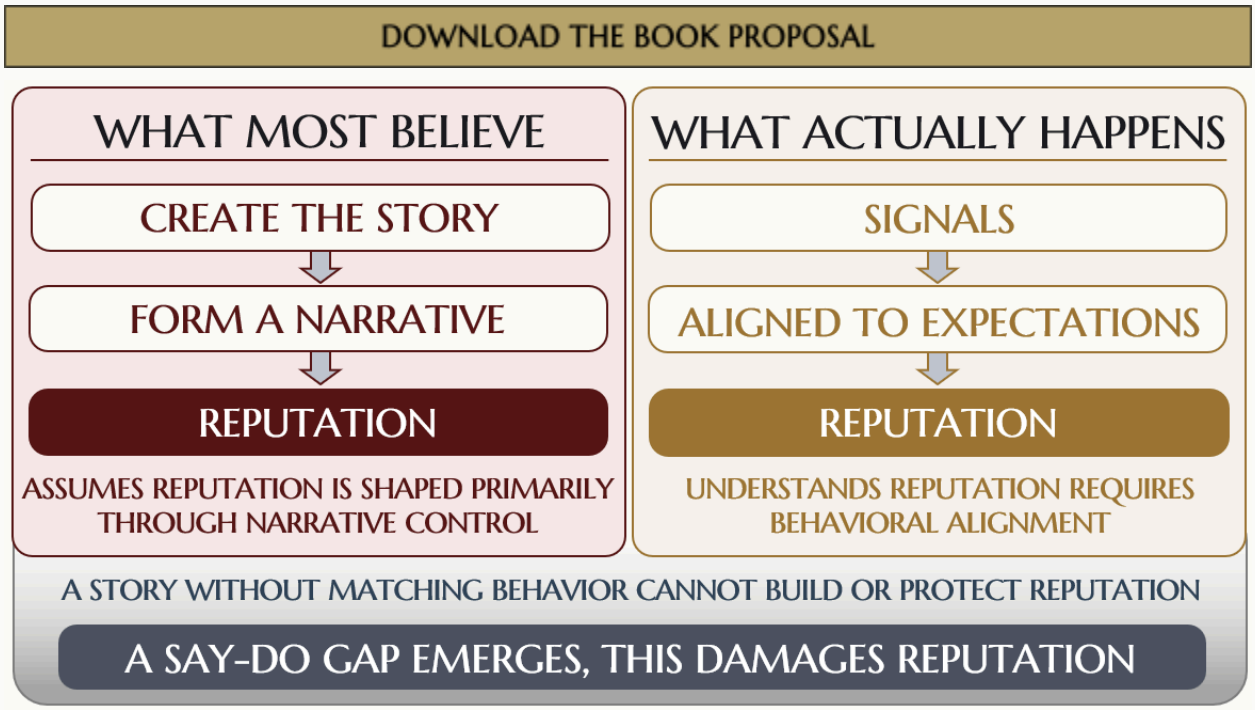
DOWNLOAD THE BOOK PROPOSAL

enough frequency and polish, can shape an institution's “symbolic compression” label. It misses something fundamental, reputation does not begin with stories alone. Stories give signals a voice, making them portable, memorable, and easier to transmit, but they do not create reputation on their own. Before reputation can form, stakeholders first observe and interpret a broader set of signals. Those signals do include the story itself, but they also involve other observable indicators such as behaviors and the decisions institutions make. Those signals are then interpreted through stakeholder expectations, producing judgments that ultimately shape reputation. This leaves reputation management focused on alignment, not only with stakeholder expectations, but with the conduct of the institutions itself. When stakeholders perceive a gap between what an institution says and what it does, a say-do gap emerges. That gap weakens perceptions of integrity and ultimately damages reputation. This is why attempts to primarily manage reputation through claims, promises, messaging and stories meant to shape a narrative often result in reputational damage instead of gains.



This misunderstanding leads to a deeper problem, which is attempting to treat reputational challenges primarily with communications strategies. The challenge with this approach, in the modern era, is that there is no centralized control over narrative. In earlier decades, stories about institutions were mediated through a small number of news outlets such as ABC, NBC, and CBS that helped provide control of what the story was.[394] But that world no longer exists, with stories scattered across thousands of networks and platforms.[395] They form in social media, in employee communications, in customer reviews, in activist networks, in industry forums, in regulatory filings, in court

[394] Starr, P. (2006). *The creation of the media: Political origins of modern communications* (Paperback ed., [Nachdr.]). Basic Books.

[395] Benkler, Y., Faris, R., & Roberts, H. (2018). *Network propaganda: Manipulation, disinformation, and radicalization in American politics*. Oxford University Press. https://doi.org/10.1093/oso/9780190923624.001.0001

documents, in leaked conversations. There is no centralized point of control to manage stories through anymore. There are only fragments, pieces, interpretations, all circulating simultaneously.

It is no longer possible to manage reputation solely through the communications function. Instead reputation will need to be embedded proactively, ahead of the narrative fragmentation and stakeholder scrutiny. This requires establishing an infrastructure which produces the signals that build perceptions of integrity early and consistently. It means creating signals that convey alignment, trustworthiness, and good faith to mitigate societal consequences and stakeholder misalignment. This transitions reputation from a concept anchored in story to a system that can produce a pattern of signals which reinforce perceived integrity. These integrity perceptions have become operationally consequential in ways it was not in earlier eras. In small communities, integrity was judged through direct observation and gossip. But in the modern reputation era, the evaluation of integrity is derived from a pattern of observable indicators, continuously, across multiple dimensions, visible to multiple stakeholders simultaneously. Stories, left on their own, will always struggle to build reputation. In the Reputation Era only a consistent pattern of integrity-driven signals

DOWNLOAD THE BOOK PROPOSAL

can provide the emotional resonance needed for an institution to earn a positive reputation label.

Passage 17: Compression & Interpretation

Summary Text (Not Included in Final Copy): Reputation continues to operate on ancient gossip logic, even at institutional scale. As systems expanded beyond direct observation, institutions needed new ways to signal integrity to stakeholders who could no longer verify behavior firsthand. Integrity heuristics emerged to fill this gap, translating complex reality into signals, certifications, and commitments that enabled distant evaluation. ESG formalized this approach, making hidden risks more legible and tying legitimacy to what could not be directly seen. But as ESG scaled, the mechanism strained. Scope expanded, compliance standardized, and signals became entangled in political interpretation. The result was not the failure of integrity, but the weakening of the signaling system itself. Integrity heuristics cannot be scaled like competence. Yet the underlying dynamic remains. Moral expectations translate into governance. When institutions fail to signal integrity credibly, those expectations

re-emerge as external constraints, imposed through rules rather than maintained through self-governance.

Earning this label in the Reputation Era is a complicated endeavor, for a number of reasons. First, this is a time period where institutions must find a way to manage their reputation in a fast-moving, fragmented, and decentralized information system. Another challenge in the modern era is the distance and size of the institutions, a knowledge gap exists where decision makers cannot have a full understanding of how the business is operating across all jurisdictions with all of its stakeholders.[396] What emerges is a three-fold alignment problem that significantly impacts how well a company can build and protect its reputation. It requires understanding the needs and expectations of stakeholders, then navigating far-flung siloed business functions to move the organization towards these expectations while trying to communicate in a highly skeptical, low credibility institutional environment. This underscores the importance of an integrity heuristic, as more than just a signal but as a simplified way to coordinate and align in a highly complex reputation ecosystem.

[396] March, J. G., Simon, H. A., & Guetzkow, H. S. (with Graduate School of Industrial Administration). (1958). *Organizations*. Wiley [u.a.].

DOWNLOAD THE BOOK PROPOSAL

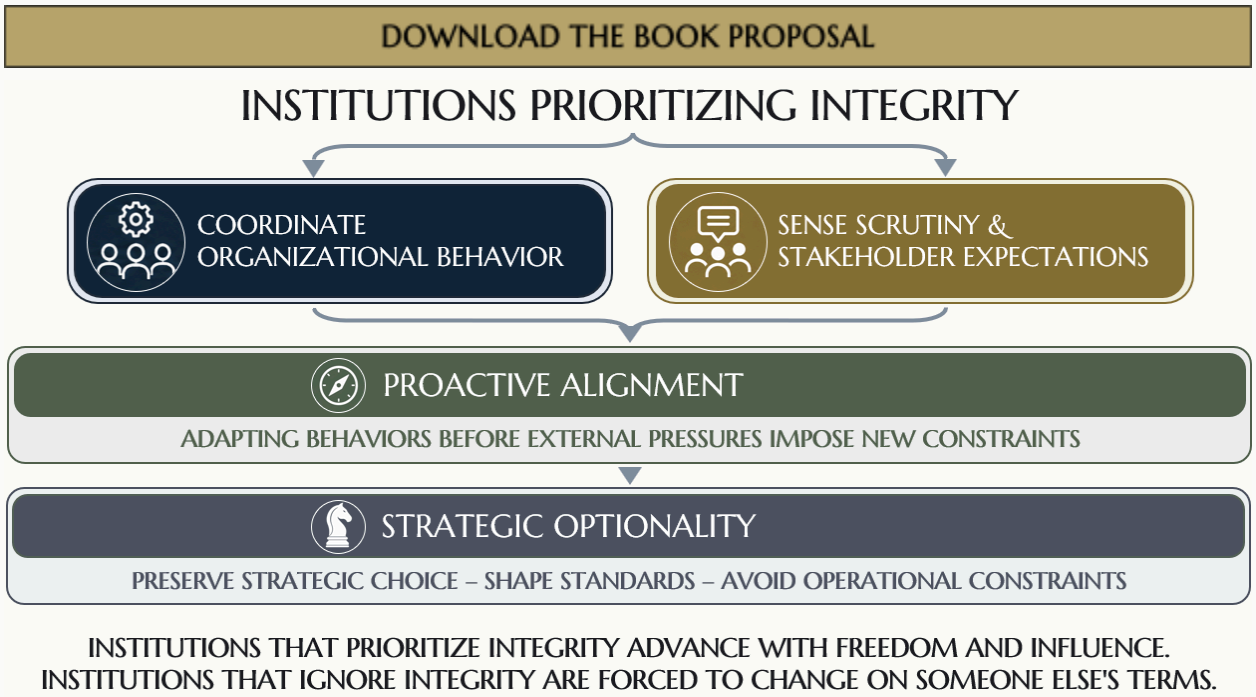
These integrity heuristics stand in for direct observation, which is no longer possible in today's environment. They become recognizable signals embedded in public narratives, reinforced by institutions, and often validated through formal certifications or standards. Integrity heuristics come in a wide range of formats, each delivering different messages and morally coded signals. Some are commitments to internal stakeholders, while others serve to build relationships with communities. They show up as signals of fairness, balance, and dignity which are delivered through business policies and practices such as diversity metrics, ISO standards, and Fair Trade certifications. An institution can signal alignment of how it uses its authority and influence through ethics policies, ESG reports, and other governance structures. While other signals show a concern for shared societal impact and loyalty through cause alignment such as environmental LEED certifications, net-zero commitments, and scope 3 emissions disclosure. All of these signals exist to fill a gap, because the scale of modern institutions has exceedingly challenged internal institutional alignment and direct observable moral evaluation.

But integrity heuristics emerged for a more urgent reason than coordinating a labyrinth of internal business functions and enhancing stakeholder perceptions. A reason why these signals emerged was because institutions recognized that integrity

DOWNLOAD THE BOOK PROPOSAL

judgements also functioned as an early warning system. When an institution prioritized integrity in how it operated it would be more likely to monitor worker treatment, mitigate environmental impact, and adopt quality governance procedures. Not because it was aiming to perform virtue or "kindness", but because it was developing the capacity to detect emerging risks that might otherwise remain invisible until they erupted.[397] Conversely, when companies operated without integrity as part of the strategic infrastructure, they accumulated hidden costs that never appeared on quarterly reports but festered in supply chains, factory conditions, environmental degradation, and governance blind spots. Costs that often followed a consistent long-tail pattern until it erupted suddenly, delegitimizing the business and sending it towards crisis. This is what makes prioritizing integrity a foundation for organizational adaptability; enabling it to continuously realign behavior with evolving stakeholder expectations before those expectations harden into reputational scrutiny, governance demands, or regulation.

[397] Crane, A. (Ed.). (2009). *The Oxford handbook of corporate social responsibility* (Reprint). Oxford Univ. Press.



Many times reputational crises are a product of hindsight, warnings that were present when the case would be reviewed after the point of failure. While each eruption seems unexpected or sudden, each reveals that had these institutions prioritized integrity as part of their reputation infrastructure, these risks would have been more likely to surface earlier and, in most cases, be mitigated or contained. Each of the following examples illustrate the point that integrity heuristics builds an infrastructure that derisks the business. A 1984 gas leak at Union Carbide that killed thousands in Bhopal, India.[398] The 2001 Enron bankruptcy filing which revealed that creative

financial engineering was not a substitute for governance integrity.[399] Decades of lawsuits filed against Johns Manville for knowingly continuing its use of asbestos as communities bore the cost.[400] Chisso dumped mercury into Minamata Bay, Japan which poisoned communities for generations and created a health outbreak in 1956 that led to decades of lawsuits.[401] In each case, the institution appeared financially successful. But underneath, the company was accruing a legitimacy debt that would be paid in lawsuits, regulatory intervention, activist pressure, consumer backlash, talent exodus, and corporate collapse.

This recognition shifted how institutions thought about signals judged through the lens of integrity, because they were valued as a means of ensuring business continuity.[402] An institution that monitored labor practices was detecting exploitation before it became a reputational crisis and legal liability. An institution that measured

environmental impact was identifying risks before regulation locked in massive compliance costs. An institution that maintained governance oversight was catching corruption and financial risk before they metastasized. This is how focusing on signals that build perceptions of integrity supports reputation and reinforces institutional legitimacy, which mitigates reputation risk before it becomes a downstream "communications problem". It creates a broader infrastructure, culture and system of adaptation before a weakened reputation leads to operational constraints and regulation.

The finding that integrity heuristics could serve as a system that both derisks the business and builds license to operate isn't new, it is a concept that was understood long before the Reputation Era. In the 1900s, George Eastman at Kodak built a welfare program with paid sick leave, accident insurance, pensions, dental care, and recreation facilities.[403] George didn't do this because a law required it, he recognized that showing care for employees created an alignment with the workforce that resulted in predictable, reliable, and stable resources that his business needed. There was no special name for this kind of business practice. It wasn't heralded in an economic impact report, stated as an attempt to drive purpose into its operations,

DOWNLOAD THE BOOK PROPOSAL

and the term ESG wasn't even thought of. None of this drove the strategy, what the business saw was the value of integrity as an infrastructure for growing and protecting the business. Some could say Kodak was pulling a play from an existing playbook that the Quaker family introduced, just decades earlier, in Bournville, England.[404] The integrity heuristic that Cadbury's would signal came from building housing, with community gardens, and providing schools for workers.[405] They even provided employees with medical care. They did it because they believed it was right and that signal was powerful. When stakeholders saw what Cadbury did, they knew they were witnessing a story of institutional character.

Prioritizing integrity into the infrastructure of how an institution operates not only makes a business agile, adapting to pressure before scrutiny forms, but it can also enable a first mover opportunity that creates a competitive advantage. Starbucks did not take a stand on ethical supply chains until it saw pressure mounting in the 1990s.[406] By the 2000s it was taking proactive steps to address coffee farming

economics, rather than trying to circumvent it.[407] They got certified for fair trade and made sustainability a core part of how they operated, demonstrating that integrity heuristics could be profitable, authentic, and integrated into consumer branding all at the same time.[408] These companies have something in common, they all operated from the assumption that integrity was infrastructure, then embedded in how the business functioned. They did not use messaging as a persuasion tool, they understood that behaviors that signaled integrity heuristics portrayed character that aligned with stakeholders.

All of this, from morals, to gossiping, to stories, to labels and integrity heuristics leads to the understanding that managing signals that build perceptions of integrity derisks the business and permits sustained business operations. All of this came before the term ESG arrived. Environmental, Social, Governance (ESG) is a framework companies use to measure and report on their non-financial performance to manage risk, show stakeholder accountability, and demonstrate regulatory engagement.[409] The term arrived in the early 2000s as a way to systematize what institutions had been doing

unsystematically for over a century.[410] Three letters that compressed the entire logic of integrity infrastructure into something measurable, codified, reportable, and comparable. For a moment, this was a genuine breakthrough because ESG created a common language that could validate the importance of integrity heuristics as a business driver. By making integrity legible to capital markets investors could not only evaluate whether a company was managing hidden risks, but further defend an investment as more predictable and reliable than other investments. Ironically, ESG was seen as a framework that would revolutionize business by validating what Kodak, Cadbury, and Starbucks (and other companies) had already discovered previously, which is that integrity should be prioritized as a business infrastructure imperative. This visionary direction for this new ESG framework did not result as planned.

A significant win for ESG was that it would correctly be seen as a tool that could justify infrastructure and investment so business could gain acceptance and grow. Because it could be measured, tracked, and linked to business results, it was seen as something worthy of continued investment.[411] But the shortcoming of ESG frameworks

became immediately apparent when they were used less to uncover expectations of stakeholder and more so to drive performative signals that they wanted stakeholders to perceive about the business. Because signals that produced perceptions of integrity had proved it could make other companies more resilient and more profitable, it would be natural to assume that vast efforts to scale integrity heuristics would lead to increased financial and operational performance. Theoretically, this is true, but when a system designed to derisk the business becomes a catch-all for every conceivable corporate value signal, then the system itself loses authenticity and becomes a potential risk to the business.

What undermined ESG was scope creep, an expansion of meaning that caused confusion and sparked tension. For the letter "E", environment originated as ensuring the company maintained environmental responsibility, but eventually the letter "E" got stuck on climate change debates, which forced it to pivot to lesser understood, confusing, eco-terms such as biodiversity, deforestation, and net-zero.[412] For the letter "S", social responsibility expanded from broader labor practices to specific racial justice, gender equity, LGBTQ+, and other groups which brought political contention

DOWNLOAD THE BOOK PROPOSAL

with it.[413] For the letter "G", governance expanded from board composition and independence to include reviews of executive compensation, shareholder rights, and political donations.[414] ESG, which was originally meant to validate the value of integrity as an infrastructure, but in the end its definition became so vast that it managed to lose meaning and get caught in a political debate. In just decades since its conception, the ESG framework became obscure, contested, and troubled.

While ESG may have brought some clarity to the value of integrity heuristics, what was made entirely clear was that when signals are perceived to be mandatory they lose authenticity. An integrity heuristic works best when it reflects genuine choice and demonstrates a commitment beyond what is formally required. The moment ESG becomes a compliance requirement, a box to check, a procedure to follow, its signal fades. The tragedy was compounded by politicization, losing ground with both sides simultaneously. As ESG expanded to include racial justice and gender equity as a mechanism of fairness, it hit a key moral foundation which is also where political ideological differences of what fairness means reside. Conservatives quickly saw ESG as woke activism, attacking it with another short emotionally charged label "Go woke, go

broke."[415] Progressives on the other hand saw it as performative gestures, attacking it with a different label "purposewashing."[416] Centuries of signaling integrity heuristics to align behaviors to stakeholder expectations, derisk the business, and promote business growth had been transformed into two short decades where ESG transformed from a neutral risk management framework into a symbol of ideological struggle that managed to lose both sides of the aisle. Vivek Ramaswamy, CEO of Strive Asset Management, argued that asset managers were using ESG to push ideological objectives beyond corporate mandate.[417] By the early 2020s, ESG was viewed by many as torn and fractured. The breakdown of the ESG framework stemmed from a catastrophic combination of scope creep, performative behaviors, check boxes that undermined authenticity, and a lack of alignment to stakeholder expectations.

Unfortunately, the mechanisms that would have sustained integrity as infrastructure broke under the weight of ESG's continued expansion. This breakdown occurred just

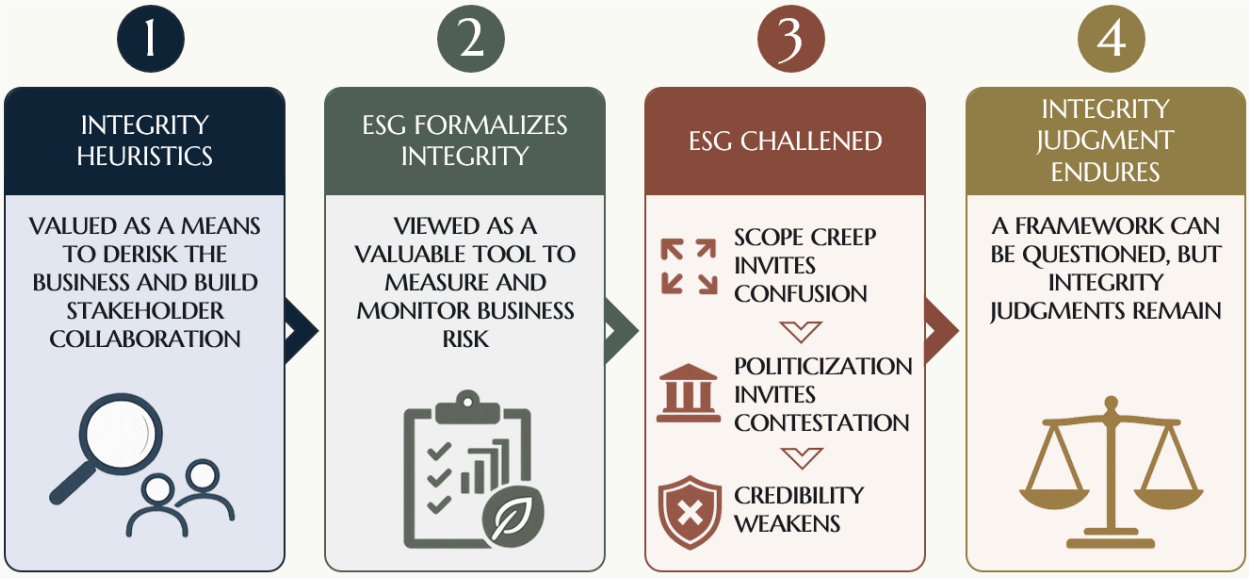
as the Reputation Era was demanding more from institutions than ever before. As organizations grew in scale and influence, stakeholders increasingly expected them not only to create prosperity, but also to mitigate the broader societal consequences of that scale. Instead, the governance architecture fractured. The pressure to demonstrate alignment only intensified, but the credibility to deliver it eroded further.



The examples of how institutional behaviors signal integrity heuristics reveal something crucial. Integrity itself, as a judgment stakeholders make when evaluating institutions, never disappeared. Instead, the systems intended to reinforce behaviors associated with integrity were mispurposed, misinterpreted, or misread. Beneath this

DOWNLOAD THE BOOK PROPOSAL

lies a deeper truth that integrity remains a lens through which stakeholders evaluate whether institutional behavior aligns with evolving moral expectations. These judgements and expectations function as early warnings, revealing where stakeholder demands will harden into formal rules. For institutions, these expectations are not just an operational infrastructure, they are a map. They show where business practices should be adapted before the rules arrive.

In the end, the breakdown of ESG, and the debate about wokeness leading to brokenness, is technically irrelevant. All that broke down was the acronym, the language, the framework. But the system that ESG was supposed to formalize was not invented by ESG. It was not born in the early 2000s. It is far older, based on ancient moral expectations. Expectations that have historically translated into governance. This has always been how societies establish the rules and guidelines that govern institutions. And this system does not stop because it was “washed out” or burned by political polarization. It continues as it always has, and always will. The institutions that prioritize integrity proactively maintain optionality and adaptability. The institutions that fail to develop integrity-driven signals will find that the rules arrived anyway. But now they arrive as constraints, not choices. And they are delivered through forced mandates, not through independent self-governance.

Passage 18: Smoke Before the Fire

Summary Text (Not Included in Final Copy): Moral expectations harden into formal rules through a pattern as old as civilization. Harm becomes visible, perception shifts, moral consensus forms, and law arrives to formalize what society has already decided. Institutions that broke their integrity infrastructure accelerated this cycle by removing the informal mechanisms that allowed self-governance, leaving only formal regulation as recourse. But institutions that maintain integrity infrastructure strategically avoid constraint rings, shape norms before codification, and eliminate reactive costs by aligning proactively. Most importantly, reputation functions as a leading indicator of what regulation will eventually require, allowing institutions that read their reputational standing carefully to anticipate the future and maintain optionality, while those that ignore it are surprised by rules that were visible all along.

The pattern of morally coded societal signals coming before the rules arrived has been consistent since ancient times. In order for formal governance to emerge, societies would align on informal norms which outlined “good” and “bad” behaviors.[418]

[418] Bowles, S. (2016). *The moral economy: Why good incentives are no substitute for good citizens*. Yale University Press.

DOWNLOAD THE BOOK PROPOSAL

These expectations are primarily based on reciprocity, ensuring groups are cohesive and collaborative. Over time people knew what was expected of them from others because the group enforced those expectations through social pressures that either elevated or eroded someone's reputation. As societies became more complex, direct observation was lost and not all disputes could not be resolved through social pressure alone. In these cases, not all cheating could be detected or quantified. Harm would be debated or denied. As a result, stakeholder pressure would galvanize into something more formal, something that could adjudicate when observation failed and mandate accountability when a damaged reputation was not enough.

A consistent pattern emerged, stakeholder pressures to enforce expectations on institutions and group dynamics commonly preceded formal legal systems.[419] Modern day courtrooms, judges, and written codes were not invented from scratch. They were formalized from social norms that were evolving informally. Consider The Code of Ur-Nammu, one of the oldest discovered legal codes, which emerged in ancient Mesopotamia around 2100 BCE.[420] It codified the fairness moral foundation to

provide guidelines of dispute resolution that societies had already been forming and practicing informally for centuries. The code simply formalized the system by creating designated officials and procedures for adjudication. It took the moral intuitions that held small communities together and institutionalized them into formal law. Like the integrity heuristic that came long before ESG frameworks, the moral foundations that shape expectations always come before the rules arrive.

This same pattern repeats in the modern era, but compressed. From ancient times through the industrial era, institutional evolution moved slowly. The lag between informal norms and formal laws could stretch across generations. Today, that lag has collapsed.[421] Moral expectations now harden into regulations in years, not decades. Visibility accelerated alongside the speed of information. As a result the consequences of corporate scale and behavioral misalignment are now hyper-visible. Stakeholder perception shifts happen faster in the Reputation Era than at any point in history. The result is a feedback loop where faster visibility drives faster stakeholder expectations formation, which then drives faster demand for formalized standards.

The Love Canal disaster demonstrates how visibility of societal consequences translates to hardened regulations.[422] In the 1940s and 1950s, Hooker Chemical Company dumped roughly 21,000 tons of chemical waste into an abandoned canal site in Niagara Falls, New York.[423] The company covered the site and sold the land for development.[424] Over time, homes and a school were built nearby. Buried toxic chemicals began leaking into the surrounding community which triggered widespread public fear of health risks and contamination.

When harm becomes visible, what follows is moral judgement and scrutiny. The public recognized that industrial companies were hiding the consequences of their decisions, externalizing costs onto communities. They observed a company operating outside the bounds of accountability and self governance. Once that realization became understood, the risk asymmetry became undeniable, and the violation of moral expectations for care triggered public demands. What happens next is inevitable, the rules arrived. Stakeholders demanded that communities should not be built on top of

toxic waste, that environmental damage should not be hidden, and that polluters should bear the cost and liability of cleanup.[425]

Moral violations typically trigger emotional discontent, then informal shared expectations, which then galvanize later as formal laws. Stakeholder pressure, in this case residents, placed demands onto the government act. Environmental advocates argued for protection which hardened into standards to reduce the shared impact on communities. That standard eventually formalized into the creation and expansion of the Environmental Protection Agency and the passage of the Superfund law in 1980,[426] which gave the federal government authority to clean up hazardous waste sites and hold polluters financially accountable. Before the rules arrived, in this case a Federal agency, there were moral expectations paving the argument for formalized codes that protected the environment and communities.

The rules arrive in many shapes and forms, not just environmental regulations. This same sequence, moral expectations before rule setting, also appears in workplace

safety. By the 1960s, companies frequently claimed to maintain safety, but not all could be verified as authentic. Before the establishment of OSHA, (Occupational Safety and Health Administration) only 38 states had workplace safety programs in place, and many were limited in scope and enforcement.[427] The patchwork created loopholes, while also creating complexity that made it difficult for companies to ensure they were fully compliant. Companies could satisfy safety codes in one state while operating outside codes in another. When the Farmington coal mine disaster killed 78 miners and made national news, the failing patchwork standards became immediately visible.[428] The public interpreted the ineffective patchwork as lax standards where companies could sacrifice worker safety to prioritize profits. Human impact, a loss of dignity, was just the cost of business.

Moral expectation reinforced the formation of new rules where workers should not die preventable deaths, that companies should be held accountable for hazardous conditions, and workplace safety should not depend on geography. National consensus hardened which led to the creation of OSHA and workplace safety

regulations that set mandatory standards and gave workers legal recourse.[429] Yet again, moral guidelines formed first, before the rules arrived.

A recent example provides the same conclusion. The Cambridge Analytica scandal revealed that personal data could be harvested, repurposed, and deployed at scale without meaningful user awareness or consent.[430] The asymmetry had always existed. Companies had always collected data. But the scale and sophistication had remained largely invisible to users. Once the breach became public, the understanding of how personal data could be weaponized at scale for political manipulation became legible. The realization that people no longer had no control over their own information became undeniable.

Pressure accumulated to create rules which mandated that users should have agency over their own data and that institutions should be held accountable for how they use personal information. In Europe, these expectations galvanized into laws faster

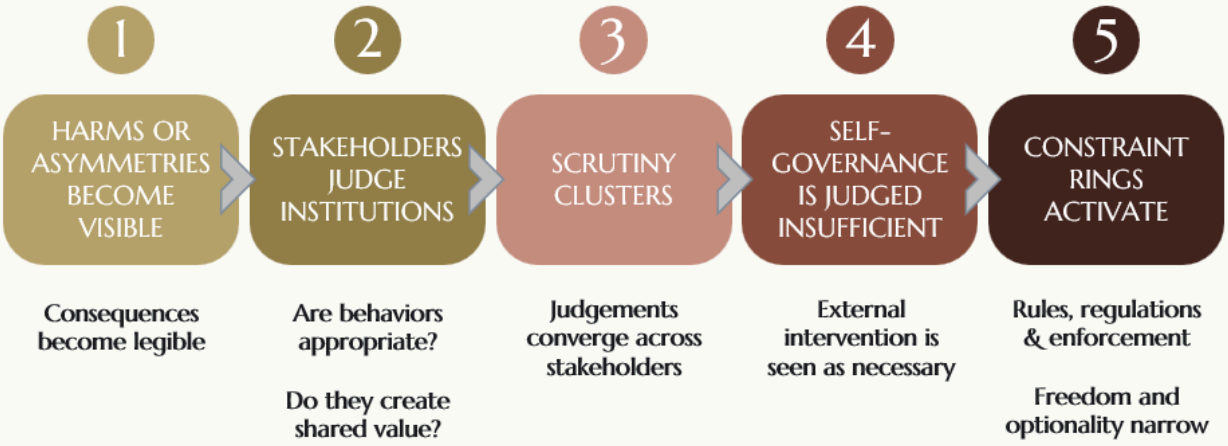
because they aligned with existing norms that treated privacy as an extension of human dignity. The scandal validated growing public demands for stronger data privacy protections, making the implementation of the General Data Protection Regulation (GDPR) in 2018 appear both timely and necessary.[431] The GDPR codified expectations through consent requirements, user rights to access and delete data, portability, and enforceable penalties. It represented an attempt to rebalance a relationship where asymmetry had become too visible to sustain.



These examples reinforce that moral expectations formalize what society has already decided should no longer be tolerated. This matters because institutions that have not integrated integrity into their infrastructure expose the business to the risk of being delegitimized. When informal accountability through self-governance fails,

DOWNLOAD THE BOOK PROPOSAL

companies are no longer seen as predictable and reliable which reduces stakeholder trust and collaboration. The credibility of these institutions becomes diminished, no longer viewed as capable to self-govern their own operations, leading to pressure for regulation and laws to arrive. It arrives as a perceived necessity to maintain the stability that is needed for collaboration to exist.

Here is where the contested arguments against ESG have misled the leaders of modern day institutions. This fracturing of ESG has been interpreted as a sign that integrity mattered less, that stakeholder expectations have dampened or gone away. The reality is that the moral expectations about what institutions should do, what risks they should manage, what stakeholders they should consider, have been present throughout history and they are not disappearing simply because ESG fractured. These moral expectations are doing what they have always done since The Code of Ur-Nammu, they are only gathering force. This governing force will do as it has always done, it will formalize into regulation regardless of whether institutions are ready. The companies that maintained their integrity infrastructure voluntarily installed adaptability into their business models. The companies that broke the signal, that ignored the informal mechanisms of accountability, will discover that formal law arrives on a schedule they do not control and in forms they did not negotiate.

DOWNLOAD THE BOOK PROPOSAL

When moral expectations harden into formal rules, and informal accountability gives way to regulatory constraint, the institutions that preserve the greatest freedom are those that align before pressure converges. This should not be confused as just a matter of ethics, it is about understanding stakeholder expectations and staying ahead of them before the rules arrive. This approach presents three distinct strategic advantages to recognizing the signals that shape perceptions of integrity early and embedding the behaviors they reward into organizational practice.

The first advantage to instituting an infrastructure of integrity is to avoid constraint rings that reduce a company's license to operate. These constraint rings, covered in *Chapter 3: The Externality Reckoning*, form when scrutiny accumulates leading institutions into increasing layers of regulatory, activist, and market pressure. Each new constraint narrows the space in which the institution can operate, often bringing new rules that reduce operations. Organizations that act early reduce the likelihood of layered constraints on the business. Instead of reacting to escalating pressure across regulators, activists, and markets, they maintain degrees of freedom by aligning before scrutiny can even emerge. Essentially these companies learn how to adapt before being forced to, and by adapting before pressure arrives they avoid the pileup

DOWNLOAD THE BOOK PROPOSAL

of constraints, costs, and risks that institutions face when they wait for the rules to arrive.

Microsoft provides a clear example. In the early 2000s, the company faced intense antitrust scrutiny, with regulators challenging its competitive practices.[432] The company internalized a structural lesson from that experience, understanding that waiting for regulators to define acceptable behavior reduces strategic flexibility. In the following decade, as data privacy concerns intensified across markets and societies, the company moved ahead of peers. Rather than waiting for regulation to arrive, Microsoft began aligning with stricter standards and supporting emerging regulatory frameworks.[433] When the General Data Protection Regulation was introduced, Microsoft did not fight it or scramble to comply at the last moment. The company extended its principles globally proactively. Stephen Cobb, senior security researcher at ESET, commended Microsoft "not only for its recent announcement on GDPR compliance, but also for providing a pretty good slate of GDPR education and compliance resources for its customers." A global data privacy officer at Intralinks also

DOWNLOAD THE BOOK PROPOSAL

noted "Microsoft is smart to be proactive on this, and hopefully, they are setting an example for smaller businesses."[434] This positioned Microsoft as moving with regulation as opposed as trying to sprint around it. By moving early, Microsoft maintained maneuverability. The business was not surprised or shocked by imposed regulatory constraints because it had already proactively integrated them.

The second advantage is norm-setting as pre-regulatory leverage. Operating ahead of emerging expectations allows institutions to shape what good looks like before it is formalized into law. When standards eventually codify, they often reflect practices already in place by early movers. In this case adaptation serves as a strategic advantage and companies that moved late find themselves playing by rules guided by their competitors. Apple demonstrated this logic with privacy. The company moved early to position privacy as a core product feature, introducing practices like on-device processing and explicit user consent controls well ahead of broader regulatory pressure.[435] Over time, many of these privacy expectations became central

DOWNLOAD THE BOOK PROPOSAL

to regulatory frameworks like the General Data Protection Regulation. Policies that gave users clear consent, data minimization, and user control were not forced on Apple by regulation, they were part of Apple's strategy.[436] This made the company a forward-looking privacy-centered trend setter for the entire industry. When regulations arrived that codified these principles, Apple was not disrupted, they were operating ahead of requirements.

The third advantage is the elimination of reactive cost and reputational repair cycles. Late alignment is expensive on two fronts. First, there is the financial cost of rapid operational overhaul under pressure. Second, there is the reputational cost of trust erosion and the long-term process of rebuilding credibility. Early integration avoids both, reducing the need for compressed transformation and years of costly reputation repair.

BP's experience with the Deepwater Horizon oil spill illustrates this cost. The disaster exposed a gap between BP's operational practices and rising expectations around

[436] Kollnig, K., Shuba, A., Van Kleek, M., Binns, R., & Shadbolt, N. (2022). Goodbye Tracking? Impact of iOS App Tracking Transparency and Privacy Labels. *2022 ACM Conference on Fairness Accountability and Transparency*, 508–520. https://doi.org/10.1145/3531146.3533116

DOWNLOAD THE BOOK PROPOSAL

environmental risk management in high-risk extraction. Investigations revealed that the disaster was not a single failure but the result of accumulated risk decisions, misinterpreted warning signals, and fragmented oversight across the system.[437] BP faced more than 60 billion dollars in fines, cleanup costs, and settlements.[438] The company had to overhaul safety systems and governance structures while under intense scrutiny from regulators, communities, and investors.[439] But the financial cost was only part of the burden. Rebuilding the company's reputation took more than a decade of aligned behaviors and communications to rebuild stakeholder trust. What might have been a gradual evolution of practices became a compressed transformation, paired with a prolonged reputational repair cycle. The company lost optionality and the ability to shape its own evolution. It was forced to adapt on a schedule defined by crisis rather than on a schedule of its own choosing.

These three advantages are interconnected. Institutions that embed integrity into their infrastructure avoid constraint rings, preserve degrees of freedom, and adapt to emerging stakeholder expectations before they are codified into formal rules. They help define what "good" looks like, and when that standard becomes law, they are already operating within it. Institutions that align proactively avoid the massive costs of reactive repair. They do not face the compressed transformation or the prolonged credibility rebuilding that institutions in crisis face.

But there is a deeper strategic implication. Institutions that maintain an integrity focused infrastructure, signal trustworthiness through consistent commitment, demonstrate alignment between what they claim and what they do, and they avoid something more fundamental. They avoid giving regulators and activists a reason to intervene. Rules are often a product of visible harm or moral asymmetry, it is these conditions that trigger expectations for regulations. Operating within stakeholder expectations slows the timing and need for formal laws to arrive.

This reinforces a central theme of the Reputation Era: reputation is not a trailing indicator to be managed after a crisis. It is a leading indicator of future business

DOWNLOAD THE BOOK PROPOSAL

conditions. What ultimately reaches the courts, regulators, or legislatures almost always appears first as reputational scrutiny. The controversies that damage reputation, the institutional behaviors stakeholders begin to question, and the asymmetries revealed across stakeholder networks are early warnings of the expectations that will eventually harden into governance and formal rules. Institutions that pay attention to reputation are, in effect, paying attention to the future. They are watching moral expectations evolve in real time, long before they are codified into law.

This layers on the crucial insight from the previous chapter. Moral expectations become rules, following visible harm and moral consensus. This means that institutions investing in their reputational standing do not have to wait for regulators to arrive and tell them what the future holds. They can read it in the controversies they face, in the questions stakeholders ask, in the expectations that are forming in networks they operate within. Reputation serves as a system through which moral expectations first become legible, giving institutions the ability to see regulations coming before they are written.

DOWNLOAD THE BOOK PROPOSAL

The institutions that maintain a proactive integrity infrastructure do this systematically. They are not just companies that are waiting for rules to arrive and scrambling to comply. They are companies that are reading their own reputation as a predictive signal. They are noticing what stakeholders question. They are anticipating what will eventually be codified. They are helping shape the direction of emerging expectations because they are paying attention to where moral consensus is forming. When those rules arrive, they arrive not as surprise constraints but as formalization of practices the institution has already adopted because it saw them coming through the lens of its own reputational standing. The companies that wait, fail to signal integrity-driven behaviors, they hollow out their accountability mechanisms and they discover that they have surrendered optionality to forces they no longer control. These companies will find that they were steering towards delegitimizing scrutiny long before the rules arrived.

Chapter 6: Separate Strategy for Separate Signals

Quote Text (Placed on the section break page): *"If you can sell a hat for one dollar you can sell it for two dollars if you stamp it with your name and make the public feel that your name stands for something.." — Andrew Carnegie at the Stevens Institute of Technology Graduation Commencement.*

Passage 19: The Rise of Brand

Summary Text (Not Included in Final Copy): Brand and reputation emerged to solve fundamentally different problems. Reputation developed as a social mechanism for allocating trust, cooperation, authority, and credibility, while brand emerged as a commercial mechanism for identifying products, signaling quality, and influencing choice across expanding markets. Over time, brand evolved from a simple mark of origin into a fully institutionalized management discipline supported by legal protections, executive ownership, academic scholarship, measurement systems, valuation methodologies, and professional infrastructure. Reputation, by contrast, remained diffuse, fragmented, and difficult to define, measure, and manage despite its growing strategic importance. As branding expanded into new domains and became the dominant framework for managing external perception, organizations increasingly used brand tools to address reputational challenges, creating the modern conflation between brand and reputation that persists today.

DOWNLOAD THE BOOK PROPOSAL

Reputation is more than a prediction of the rules to come. It is the mechanism through which legitimacy, institutional acceptance, and trust are derived. Throughout history, reputation evolved not as a business strategy, but as a societal infrastructure that enabled reciprocation among people who needed to decide who could be trusted, who would honor commitments, and who deserved continued collaboration. As the previous chapters have shown, reputation solved a fundamental human problem long before it became associated with corporations or a communications function. It emerged as a system for interpreting signals, reinforcing group cohesion, and allowing societies to coordinate around shared expectations.

Viewed through this lens, one conclusion becomes unavoidable. Reputation is fundamentally different from the way it is commonly understood in modern business. Yet despite its origins as a social coordination system, reputation has become deeply intertwined with another concept that evolved for an entirely different purpose: brand. Today the two are frequently treated as interchangeable.[440] Executives speak of building a "brand reputation,"[441] communication teams are often tasked with

DOWNLOAD THE BOOK PROPOSAL

managing both under the same function,[442] and many organizations rely on branding frameworks to solve reputational problems.[443] The "brand reputation" confusion tracks all the way to the top of institutional leadership. According to the BoatHouse Report, 71% of CEOs view their company brand and their reputation as the same thing.[444] This conflation has done more than create semantic confusion. It has narrowed reputation into a communications exercise, obscuring its much broader role in preserving legitimacy, maintaining institutional freedom, and helping organizations anticipate the moral expectations that eventually become tomorrow's rules.

To understand why this confusion exists, we have to look backward. Reputation and brand did not emerge together, nor were they created to solve the same problem. They arose centuries apart, under different conditions, to address fundamentally different human needs. Their histories followed separate paths before gradually converging in the modern era. Understanding those distinct origins is essential

DOWNLOAD THE BOOK PROPOSAL

because the differences between them explain why organizations so often reach for the wrong tools when facing reputational challenges.

Brand came much later in history, with its own unique evolution. Unlike reputation, which evolved as a natural societal mechanism, brand was intentionally created to solve a range of different commercial problems. This is a core difference between the two, one is a social construct, the other a tool. Brand, in a sense, is a *"technology"* that solves marketplace trade problems.

BRAND	REPUTATION
Deliberately managed	Emerged socially
Establishes an offering	Evaluates conduct
Enables choice	Enables collaboration
Based on marketplace signals	Based on shared expectations
Can be owned and protected	Cannot be owned

Understanding this distinction is not just important, it is consequential. Reputation is a societal norms-based collaboration problem, while brand is a framework designed to drive choice. When organizations confuse the two, they often manage reputation with the wrong tools, inviting scrutiny that ultimately erodes institutional legitimacy.

DOWNLOAD THE BOOK PROPOSAL

To understand how most modern institutions came to conflate the two, we must first understand where each originated. Their histories reveal that reputation and brand emerged to solve fundamentally different problems and evolved along separate paths. Yet those same histories also explain why their meanings gradually converged, making it almost inevitable that they would become confused in the modern era.

The origin of brand begins as a simple mark. The purpose was straightforward, meant to identify ownership and origin. The canonical brand story begins with its use by herders to mark, or "brand", their cattle[445]. As livestock domestication spread, ownership marks emerged as a practical way to distinguish animals within expanding herds. By at least 2700 BC, branding was already being used for this purpose.[446] By 1300 BC Egyptians expanded the use case of brand, marking wine amphorae with a seal so people could understand the vineyard, the quality, and the year of the production.[447] Brand had beyond a symbol of ownership, to a label that provided people with context. Over centuries, it would evolve commercially, to sustain trade

and build connected marketplaces. By the medieval times production in Europe would face a velocity gap, where products were being sold further away from its point of origin.[448] Blacksmiths needed to provide a symbol that could authenticate the quality of their work to people that would have little to no information about what they were purchasing.[449] The blacksmith's brand signaled that this product came from a known maker so buyers could form evaluation and product expectations. This moved the importance of brand beyond simple informational context to non-verbal cues of performance assessment and product recall.

Brand found itself becoming a multi-function tool that could serve multiple purposes. Its next use case would be in formalizing marketplace rules and governance. By the thirteenth century, identifying marks had become sufficiently important that guilds and municipal authorities increasingly regulated their use.[450] In 1266, King Henry III of England issued the Assize of Bread and Ale, requiring bakers to mark their loaves with unique symbols so regulators could trace them.[451] Bread was a staple that society

needed, so poor quality and fraud could significantly affect the health of entire populations. By requiring brands, the crown could hold individual bakers accountable for the goods bearing their symbol. Brand evolved again, as legal instruments of regulatory enforcement. This trend expanded, in medieval Florence, metalworkers kept formal registers of brands to ensure a product came from an authorized, trained craftsman.[452] This protected buyers from counterfeit or inferior work, while also protecting the guild from being imitated by unaffiliated smiths. Brands, throughout their history, had proven to be a transformational technology that would ensure marketplaces could grow within standardized, enforceable codes.

The mobility velocity gap, which is the physical distance that trade could span, would only intensify through the industrial era. Scale and speed made production possible across vast distances in a matter of weeks rather than several months.[453] Verification of product quality through word of mouth couldn't keep up. A factory in Manchester, England could produce thousands of items destined for customers in London, Berlin, or Boston that had never experienced, or witnessed, the product being used. When the product arrived, the brand on the product would serve as more than a legal

construct, it would be a signal that could influence consumer choice. In response companies started investing in brands, as valuable assets that could influence sales.[454]

Brands had arrived as powerful symbols that carried associations and stories of quality, origin, and esteem. With the influence and importance of brands on the rise it was quickly recognized that this marketing tool would require legal protection. By the arrival of the twentieth century brands, also known as marks, had officially become a "trademark" which required institutionalization.[455] The Paris Convention in 1883 created the first international trademark treaty, a moment that would set the stage for brand to become a business practice, an academic topic, and a measurable asset. The greatest transformation for brand was still to take place.[456]

The twentieth century revolutionized and modernized thousands of years of using a brand to stabilize trade and drive choice in the marketplace. This time period would be the "New Dawn" era, a time where brand would take the step to become a vital,

virtually mandatory, business strategy. In 1903, a booklet called *The Value of Advertised Trademarks*, written by Ben B. Hampton Co. Advertising Agents made the observation that captured the attention of business leaders, marketers, and salespeople.[457] The finding was that a branded stamp on products could double sales prices, commanding a premium over an unmarked choice in the marketplace. This quickly caught the attention of business leaders, not just because it was profitable, but because the impact of brand could be quantified and measured. As a rule of thumb in business, when something can be quantified, it can be valued and if it has value it gets infrastructure, such as budgets, reporting, and roles.

Unsurprisingly it only took decades for brand to gain that infrastructure. It started in 1931, originating at Procter and Gamble, when Neil McElroy issued a memo that formalized the role of the brand man.[458] Each major product would have a dedicated manager responsible for studying sales, advertising history, competitor weaknesses, and creating marketing plans from this analysis.[459] The brand man was accountable for building marketplace competencies that enhanced business performance. While this is

a commonplace practice in the modern era, it was revolutionary for its time. What it meant was that brand was more than a marketing tactic, it was a strategy with dedicated ownership within the business. This meant more than just staff and funded budgets, it meant companies were creating a dedicated business infrastructure around the concept of branding.

That infrastructure would expand naturally and rapidly. Brand management, taught through marketing principles would sprout in the 1930s academics from the same place that Neil McElroy heralded from, Harvard University.[460] The transition from business practice to academic discipline followed in the 1950s, when the ideas behind modern branding began appearing in publications such as the Harvard Business Review, helping establish branding as a legitimate field of academic inquiry.[461] In the same decade brand philosophy would be coined in terms such as "Marketing Mix" by Harvard professor Neil Borden.[462] By the 1960s, brand management had become an established managerial practice and an increasingly important subject of academic

research and business education.[463] Later, in 1967 Philip Kotler published the first edition of his textbook *Marketing Management: Analysis, Planning, and Control,* which would become a staple of the MBA program.[464] Kotler would establish the definition of brand as a name, term, sign, symbol, or design used to identify and differentiate a product offering.[465] Among most academics it was often framed as a seller's promise to deliver a certain bundle of features, benefits, and services.[466] A leading conclusion in the field was that without brand products would become commodities, where price dominates consumer choice.[467] This meant that brand not only drove choice in the marketplace, but it justified price margins and prevented products from becoming commoditized.

But what secured brand as a legitimate business practice wasn't the textbooks and case studies, it was business consultants and valuation modeling. Advertising and marketing agencies arrived with measurement frameworks and activation strategies

that gave brand both scientific and creative spirit. It started with Interbrand, founded in 1974 by a former Dunlop corporate planning executive, John Murphy, who introduced a model for testing and developing product names.[468] In less than two decades brand advanced to revolutionize corporate finance, proving that it could be quantified as a multi-million dollar asset on balance sheets.[469] For the first time, brand could be assigned a monetary value using a standardized methodology.[470] Interbrand's methodology would forever link brand to corporate value. With the success, a swath of consultancies followed. Kantar developed the BrandZ database, and a unified measurement system (MDS: Meaningful, Different, and Salient) which quantified awareness, preference, and equity and validated them as predictors of performance.[471] Landor, Wolff Olins, Siegel+Gale, and Prophet, just to name a few, built entire firms focused on brand strategy.[472] The brand consultancy industry legitimized brand strategy through standardized deliverables, audits, identity systems, scorecards, databases, and valuations.

These standards offered a self-reinforcing system where academics and consultancies provided frameworks that translated brands to business value, which further galvanized boardroom support for continued brand infrastructure investment. Because a brand could be valued like a financial asset, it arrived as something legible, discussed in the language executives easily understood. The rationale and case for brand infrastructure was made easy by a calculated return on investment brand initiatives. By the 1990s, brand valuation had moved further into corporate finance and accounting. Under standards such as IFRS IAS 38, acquired brands could be recognized as identifiable intangible assets when the relevant accounting criteria were met.[473] This gave brand something reputation lacked, which is a formal pathway through which certain brand assets could be valued, recorded, transferred, and examined through established financial practices. Brand was no longer only a marketing concept; it had become a commercially legible asset.

With such a wide range of strategic uses, businesses needed executive-level leadership to steward and protect their brand assets. Roughly six decades after the emergence of the brand man, the title of Chief Brand Officer (CBO) began to take hold across industries.[474] Organizations increasingly recognized that brand required dedicated leadership, with one notable example being the appointment of Charlotte Jones,

daughter of Dallas Cowboys owner Jerry Jones, as Chief Brand Officer in 2013.[475] In that role, she oversaw the team's visual identity, stadium experience, merchandising, and broader brand strategy. The emergence of the Chief Brand Officer represented more than the addition of another C-suite title. It marked the institutionalization of brand as a distinct business function, supported by specialized teams responsible for marketing, strategy, creative development, measurement, and brand portfolio management.

Entering the modern era institutions had developed brand infrastructure that was fully equipped to solve a variety of business problems, and it worked quite well, almost too well. With use cases continuing to expand, the definition of brand did as it always did, it continued to widen. What began as a simple mark of origin had evolved into product brands, corporate brands, employer brands, and even brands for places. Cities began nation branding initiatives. Countries appointed branding agencies to shape their global identity.[476] Personal branding became common in the digital age.[477] Every

entity that needed to be noticed and chosen began thinking of itself as a brand. Branding logic spread into domains far beyond consumer products. Now brands were created for universities, hospitals, and political movements just to name a few. The concept of brand was becoming a catch-all framework for any kind of identity and perception management. The momentum of brand expansion would quietly pose a significant threat to the legitimacy of businesses in the Reputation Era.

As the popularity and importance of brand surged on, an irony emerged. Brand became an ubiquitous, highly institutionalized, practice while also becoming difficult to contain and increasingly harder to define at the same time. The irony lands, the success of brand management also created its own brand problem. A history of continually expanding into new domains meant organizations were accustomed to applying branding logic to everything from corporate identity, to employer appeal, to social purpose. The term brand started to mean different things to different people, and even academic scholars could no longer agree on what brand actually was anymore.[478] David Aaker would define the term brand as a set of associations linked to a name and symbol that create equity through loyalty, awareness, and perceived

DOWNLOAD THE BOOK PROPOSAL

quality.[479] While Kevin Keller defined brand as a perceptual entity residing in consumers' minds, where brand equity emerges from brand knowledge and differential consumer response.[480] Another perspective, from Jean-Noël Kapferer, defined brand as a name with the power to influence, a shared desirable and exclusive idea that is embodied in products and services.[481] Each scholar was describing something similar, while also giving it a different lens.

This definitional sprawl reflected a deeper problem. As brand frameworks expanded beyond product marketing into corporate brands, employer brands, purpose-driven positioning, and stakeholder engagement, the concept absorbed increasingly broader responsibilities. Brand came to encompass not only differentiation and preference, but also values, culture, authenticity, trust, accountability, and social responsibility. In doing so, it began to occupy territory that more naturally belonged to reputation. This expansion was not the result of branding overreach so much as the absence of an alternative. Reputation never achieved the same institutional maturity as brand. It

lacked a widely accepted definition,[482] a dedicated business function, a coherent valuation model, and a unified academic tradition. In that vacuum, organizations naturally turned to brand frameworks to solve problems that were fundamentally about stakeholder alignment and social acceptance.

As threats to institutional legitimacy arrived, institutions naturally saw brand as the appropriate pathway to a solution. This pattern reflects what behavioral scientists Gabrielle Adams and her colleagues at the University of Virginia identified in their 2021 Nature paper, *People Systematically Overlook Subtractive Changes*.[483] In a series of experiments, participants were asked to improve objects, puzzles, and systems that could be enhanced either by adding something or by removing something. Consistently, participants defaulted to additive solutions. In one experiment, individuals were shown a Lego structure with an unstable roof supported by a single block that seemed awkwardly placed and unnecessary. Even when participants were told that there would be a financial penalty to add legos to the structure, the majority of participants still decided that the best way to stabilize the structure was to

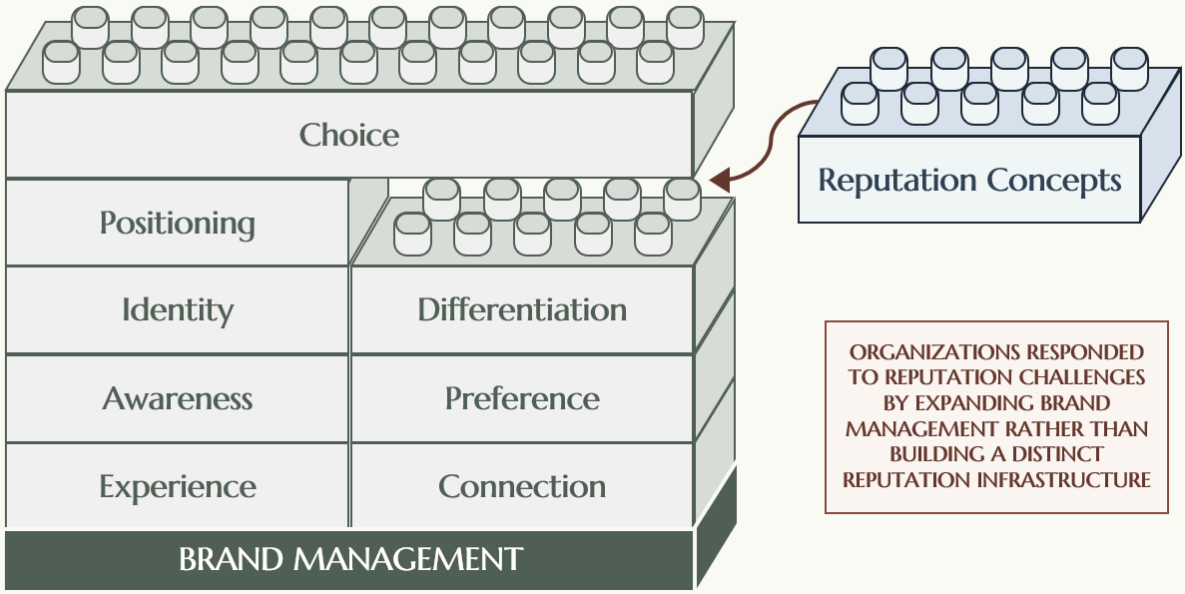
add more blocks rather than simply removing just one piece.[484] The evolution of brand and reputation resembles what these behavioral scientists have observed. As reputation-related challenges escalated through the Reputation Era, organizations largely responded by adding new perceptions and stakeholder expectations to existing brand frameworks. The more obvious subtractive solution, to remove reputation concepts from the brand structure and develop a distinct infrastructure was rarely considered.



Aside from the inferred additive bias, four other factors offer explanations as to why reputation has yet to fully emerge as its own discipline, with its own infrastructure.

[484] Why people forget that less is often more. (n.d.). *The Economist*. Retrieved July 21, 2026, from https://www.economist.com/science-and-technology/2021/04/14/why-people-forget-that-less-is-often-more

DOWNLOAD THE BOOK PROPOSAL

First, is that aspects of managing reputation were formed pre-emptively, before it was more properly understood. From adhering to regulatory codes, to managing public perception, to building relationships with investors, these functions were already siloed within the business before reputation, in its entirety, was conceived. The second reason is that brand management had become highly matured, understood, and bought in as an industry imperative that could deliver measurable results quickly and reliably. This made the inclination to handle reputational challenges through a brand framework both natural and alluring. A third explanation is the legal and financial infrastructure surrounding brand. Brand identifiers can be formally protected through trademark law, and brand assets can be licensed, transferred, bought, sold, and financially valued.[485] In certain circumstances, particularly when acquired through a business combination, brands can also receive formal accounting recognition as intangible assets. Reputation has no comparable ownership structure. It may create or destroy enormous economic value, but it remains an externally formed stakeholder judgment that an institution cannot directly own, trademark, or transfer. The last contributing factor is the definitional timing. Brand has always been an innovative tool to solve a business problem first, with the definition coming later. And even then, the definition had become accustomed to changing and expanding to fit the business cases at that point in time. For these reasons the concept of brand as a business

solution, a marketplace tool, and a definition naturally adapted, evolved, and arrived before reputation did.

The implication of brand arriving first only further complicated reputation's ability to establish itself. By the time organizations began confronting reputation as a strategic challenge, brand was already deeply entrenched, complete with its own language, executive leadership, measurement systems, consultants, and academic foundations. Reputation, by contrast, remained institutionally homeless, scattered across multiple functions, concepts, and disciplines. Public relations, corporate communications, investor relations, corporate social responsibility (CSR), environmental sustainability, human resources, legal, and compliance each managed a piece of reputation, but no function owned it in its entirety.[486] This fragmentation was not incidental. It was structural. Building a true reputation function would require authority that crossed organizational silos, unified incompatible metrics, coordinated multiple stakeholder groups, and aligned resources across competing budgets. Few organizations were designed to do that.

It would not always be a conscious decision to subvert reputation in favor of expanding brand infrastructure. Executives became accustomed to the rapid nature of implementing and extracting the benefits of brand engagements. A successful brand campaign could show measurable outcomes in quarters, where reputation could not easily provide similar proof in comparable timeframes.[487] Brand frameworks would naturally be more desirable because they held a track record of delivering quickly and reliably while reputation asks business executives for patience and resource intensive systems-based thinking beyond quarterly cycles.

Another significant advantage brand held over reputation was its formal infrastructure of protection, ownership, and valuation. Trademarks gave organizations enforceable rights over brand identifiers, while licensing, acquisitions, and valuation methodologies allowed brands to be treated as transferable commercial assets.[488] Reputation, by contrast, remained an assessment held by stakeholders. It could influence enterprise value, regulatory treatment, and institutional freedom, but it could not be directly owned, transferred, or protected in the same manner as a trademark.[489] Without

comparable valuation standards, accounting recognition, or ownership rights, reputation was more difficult for organizations to isolate, govern, fund, and defend as an independent management discipline.

Brand gained momentum and coalesced into a more centralized academic and practitioner understanding through the twentieth century, which gave it *gravitational force* making it a default framework for evaluating institutional identity. As brand gained traction and momentum, reputation was doing the opposite, scholars simply could not agree on what reputation was.[490] Charles Fombrum, who later founded the Reputation Institute, would define it as collective assessment relative to competitors.[491] But other views on reputation persisted. The diffusion of definitions and points of view led Mike Barnett to conclude in his paper *The Definitional Landscape* that reputation was being defined in contradictory ways, trying to be awareness, assessment, and an asset simultaneously.[492] Lacking a unified definition, reputation would struggle to establish itself as a separate philosophy from brand, further leaving it conceptually homeless.

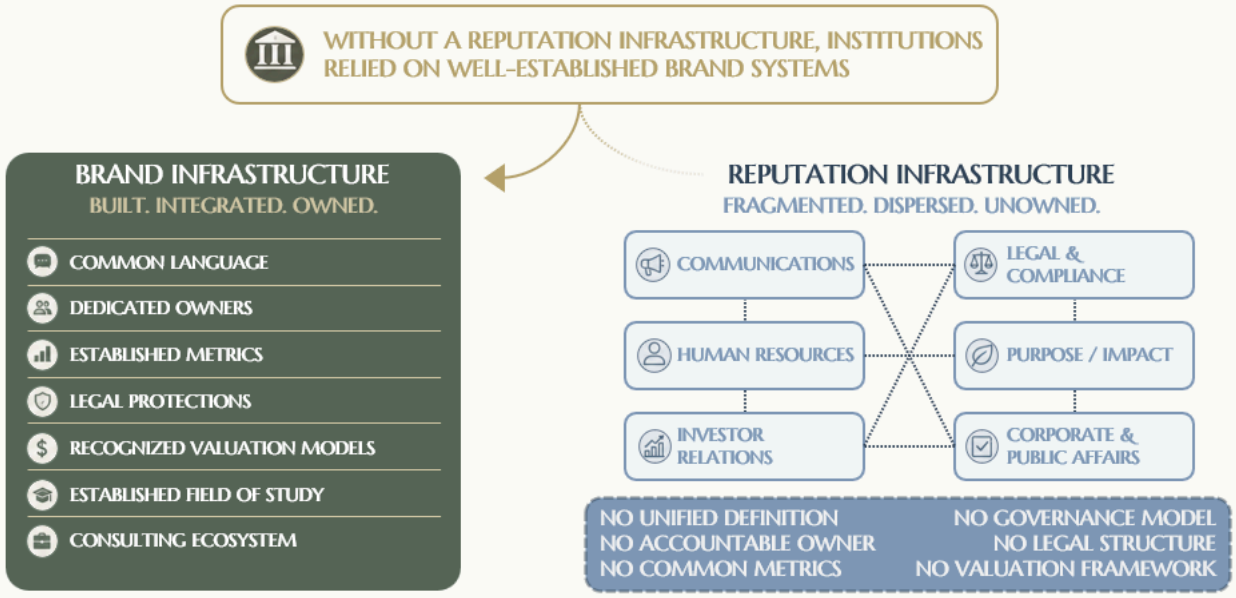
Why Brand Became the Default Infrastructure for Emerging Reputation Challenges



The result was almost inevitable. Organizations managed reputation through the only framework they knew, the only one they could define, defend, measure, and own. Reputation was reduced to messaging, public relations, and brand promises, while corporate social responsibility, environmental sustainability, and purpose became extensions of the broader brand narrative. As expectations evolved, authenticity, trust, and values were incorporated into established brand scorecards, further blurring the distinction between the two. When reputational challenges emerged, organizations responded with brand campaigns or reactive communications rather than addressing the underlying institutional dynamics. The confusion between brand and reputation was sometimes intentional, often convenient, but most frequently the product of an intellectual and organizational vacuum. The consequences were significant.

DOWNLOAD THE BOOK PROPOSAL

Organizations increasingly promoted values that were not consistently reflected in their behavior. These say-do gaps weakened credibility, invited greater scrutiny, and eroded institutional legitimacy. The more stakeholders perceived inconsistency between what organizations claimed and what they did, the more difficult collaboration became.

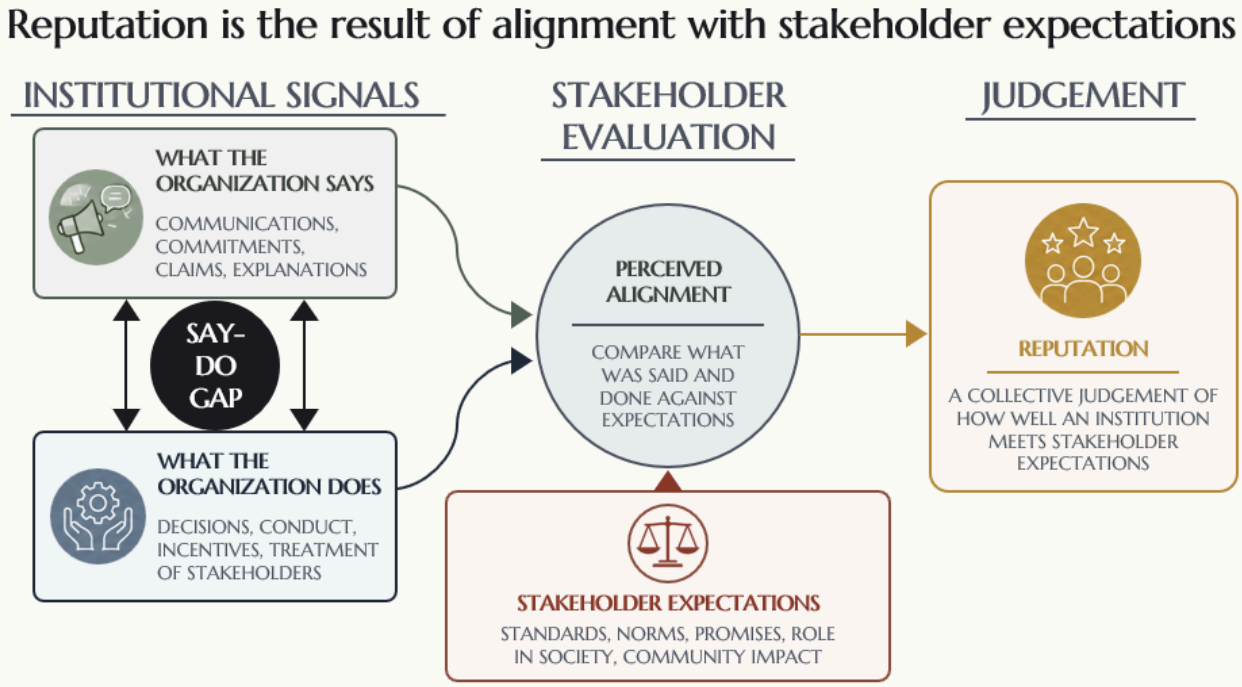
Passage 20: Permission and Preference

Summary Text (Not Included in Final Copy): Brand and reputation solve fundamentally different problems, yet organizations have conflated them for a century. Brand was designed to drive choice in markets through differentiation, positioning, and consumer appeal. Reputation, by contrast, is the mechanism through which institutions earn legitimacy and stakeholder acceptance. Legitimacy is granted externally based on stakeholder judgment of an institution's prosperity and integrity, and it cannot be manufactured or owned. Once reputation is understood as the primary driver of legitimacy, it becomes clear that brand and reputation require separate infrastructure, distinct strategies, and independent purposes.

DOWNLOAD THE BOOK PROPOSAL

The conflation of brand and reputation has been costly not only for reputation, but for brand as well. First, it obscured a discipline that had once been comparatively well understood, making the meaning of brand increasingly ambiguous in the modern era. Brand stretched to beyond choice, preference, differentiation, meaning, experience, connection to encompass values, culture, authenticity, trust, accountability, social purpose, employee engagement, and legitimacy all at once. Under that weight, the concept began to lose its precision. The underlying discipline was not merely broadened; it became conceptually muddled. The second cost was that reputation remained less understood and less distinct. Without a clear definition or strategic purpose, business leaders had difficulty seeing how reputation could address business challenges beyond communications and perception management. Conflation obscured a simpler understanding of reputation, that it is a collective judgment that stakeholders form when they evaluate institutional behavior and communications against their expectations.

DOWNLOAD THE BOOK PROPOSAL



As brand and reputation became increasingly conflated, the discussion shifted toward identifying the difference between the two. Lost in that process was a more fundamental question, "What problem does reputation solve?". Overlooking that question, meant the relationship between reputation and legitimacy gradually disappeared from both academic thought and business practice.[493] Without that connection, organizations struggled to develop a coherent theory of reputation because it was never presented as a distinct business solution. As a result, reputation became something to influence rather than something to build. Meanwhile, as

[493] Deephouse, D. L., & Carter, S. M. (2004). *An Examination of Differences Between Organizational Legitimacy and Organizational Reputation* (SSRN Scholarly Paper No. 2268774). Social Science Research Network. https://papers.ssrn.com/abstract=2268774

corporations became increasingly sophisticated in their ability to manage brands, they also became increasingly dependent on reputation without fully understanding the role it was playing.

The argument that follows is simple. Reputation solves a problem that brand cannot durably solve on its own. Brand primarily influences the marketplace, while reputation aligns with stakeholders to support and sustain legitimacy. Once that distinction is understood, reputation can finally be seen not as an extension of brand, but as the infrastructure that enables institutions to secure stakeholder collaboration, withstand scrutiny, and preserve their license to operate.

Simply put, legitimacy is the condition that allows an institution to be accepted as appropriate, valuable, and entitled to grow and expand. It connects reputation to outcomes that directly affect institutional freedom, regulatory tolerance, access to resources, and the willingness of stakeholders to collaborate with the institution. Organizational theorist Mark Suchman defines legitimacy as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions."[494] It

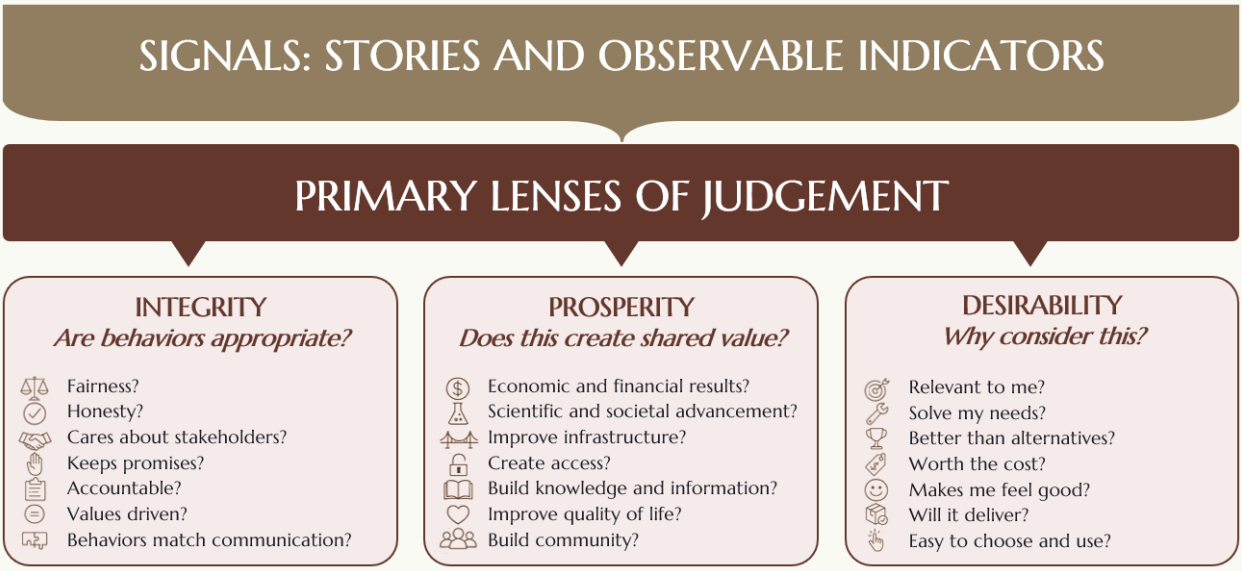
[494] Suchman, M. C. (1995). Managing Legitimacy: Strategic and Institutional Approaches. *The Academy of Management Review*, *20*(3), 571–610. https://doi.org/10.2307/258788

DOWNLOAD THE BOOK PROPOSAL

is this emphasis of deemed acceptance that is important, because it means that legitimacy does not reside in claims, instead it is granted, or revoked, through judgment.

This judgement primarily flows through the lenses of desirability, prosperity, and integrity. Desirability is an assessment of whether an institution, product, or experience is attractive, meaningful, and worthy of choice. Prosperity assesses if the institution creates sufficient value for stakeholders and society to justify its reason for being. While integrity examines behavior, determining if they are appropriate and aligned with stakeholder expectations. These lenses can be, at times, interconnected, but each perform a different function, with a different conclusion. Commonly the lens of desirability drives brand strength, influencing choice in the marketplace. The prosperity and integrity lens primarily shape reputation by influencing whether an institution is considered beneficial, reliable, and predictable. Together, these three lenses contribute to the determination of institutional acceptance.

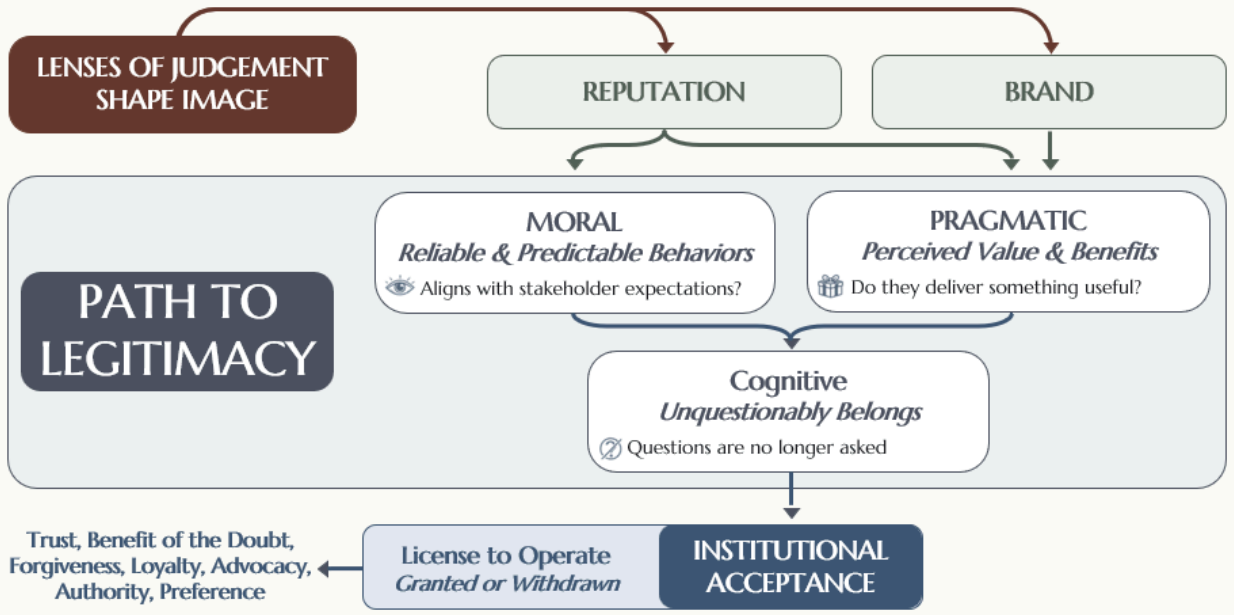
DOWNLOAD THE BOOK PROPOSAL



As the research of Mark Suchman illustrates, legitimacy is formed through three different constructs. The first construct, pragmatic legitimacy, is best understood by institutional leaders. This pragmatic legitimacy asks whether an institution creates enough value for stakeholders to justify its continued existence. Judgement within the Prosperity and Desirability lenses plays a significant role in determining if an institution is granted pragmatic legitimacy. The second legitimacy construct is moral legitimacy, which asks whether the institution behaves in ways stakeholders consider proper and acceptable. Integrity is the principal foundation by which institutions are granted moral legitimacy. Over time, sustained pragmatic and moral legitimacy can contribute to cognitive legitimacy, as an institution becomes increasingly familiar, comprehensible, and taken for granted.. This is a more durable condition in which the institution's role becomes broadly accepted and stakeholders no longer continually

DOWNLOAD THE BOOK PROPOSAL

question whether it deserves to exist. As institutions continue to accumulate legitimacy they are granted license to operate which enables trust, loyalty, authority, and other outcomes that strengthen the influence and resilience of the institution.



This clarifies two important features of reputation. First, reputation is the outcome of stakeholder judgments, evaluating how well the institution's behaviors align with stakeholder expectations. Second, reputation is a primary mechanism through which an institution earns legitimacy. Put simply, reputation exists to secure stakeholder acceptance across a diverse, and often conflicting, sets of expectations. This is where confusion often arises. Stakeholder acceptance can also become a powerful source of

DOWNLOAD THE BOOK PROPOSAL

differentiation and preference. Companies such as Patagonia,[495] Ben & Jerry's,[496] and Unilever[497] have demonstrated that efforts to operate in environmentally sustainable and socially responsible ways can strengthen reputation, through integrity judgement, while simultaneously reinforcing desirability. While reputation may, oftentimes, influence brand outcomes, it should be understood that this is not its primary function. Its primary function is to establish legitimacy.

The complication is not that brand has no relationship to legitimacy. It is that brand desirability can produce enough pragmatic acceptance to make institutions believe legitimacy has been secured more broadly. Strong brands create desirability by signaling meaning, differentiating products, and emotionally connecting with consumers.[498] Quality, prestige, convenience, safety, affordability, and engagement all

contribute to that desirability.[499] Over time, repeated positive experiences reinforce loyalty and advocacy.[500] Because desirable brands encourage continued engagement, they can sustain stakeholder acceptance even as broader reputational alignment begins to weaken. This creates a common false positive, where continued preference in the market is mistaken for durable legitimacy. Strong brands may delay or obscure the consequences of reputational decline, but desirability alone cannot indefinitely compensate for weaknesses in prosperity or integrity.

This explains why many institutions in the modern era still believe that it can maintain enough institutional acceptance through strong brand delivery. Take for example TikTok, a company that has endured several points of reputational criticism which challenges its license to operate in the United States.[501] The platform has been contested in several ways by several different stakeholders. The two largest points of scrutiny include issues of fairness, which argues that there was unequal market access

between China and the U.S., and the issue of care, with concerns of data collection that leads to user harm and a threat to democracy itself.[502] The reputational challenges were significant, prolonging for years, but TikTok maintained its acceptance primarily through its ability to deliver an experience considered by many to be superior in the marketplace.[503] TikTok's superior brand was positioned as creating prosperity, through its creator economy and cultural impact.[504] What loomed in the distance for TikTok eventually arrived. Because TikTok could not adjust corporate behaviors to match the expectation of stakeholders, the rules arrived anyway, despite its superior brand position. The TikTok example showcases how pragmatic legitimacy, as the primary source of acceptance, does not alleviate reputational risks and it leaves institutions vulnerable despite continued brand success.

The limits of brand-driven acceptance became visible on January 22, 2026, when ByteDance was forced to sell TikTok's U.S. operations to Oracle.[505] The sale addressed

an important regulatory concern, but it did not erase years of accumulated reputational debt. Shortly afterward, a winter storm disrupted Oracle's data infrastructure, degrading the user experience that had become central to TikTok's appeal.[506] Videos failed to post, engagement collapsed, and many creators received no views.[507] Under ordinary circumstances, stakeholders might have interpreted the disruption as a temporary technical failure. Instead, because TikTok had already accumulated years of legitimacy challenges, the outage was immediately viewed through a lens of suspicion. That suspicion intensified following the death of Alex Pretti during an encounter with ICE agents.[508] As videos about the incident failed to circulate on TikTok while appearing across competing platforms, users increasingly concluded that the company was suppressing politically sensitive content.[509] Whether the disruption resulted from technical failures or intentional censorship quickly became secondary. The absence of reputational goodwill meant TikTok received little

benefit of the doubt. Public figures including California State Senator Scott Wiener, musician Billie Eilish, and comedian Meg Stalter accused TikTok of censoring anti-ICE content[510]. Major media outlets, including The New York Times, CNN, The Washington Post, Variety, and The Independent, amplified the controversy by asking a simple but consequential question: Is TikTok censoring anti-ICE content?

The episode illustrates the relationship between brand, reputation, and legitimacy. TikTok's highly desirable product had sustained pragmatic legitimacy for years, despite persistent reputational challenges. But once the platform failed to deliver its core experience, accumulated questions about its integrity quickly resurfaced. Brand desirability had delayed the consequences of weakening legitimacy. It could not ultimately prevent them. TikTok provides just one example of why pragmatic legitimacy can be easily misunderstood as the primary conduit for building institutional acceptance. Because it can be successfully "gamed" through a strong brand it can lead to complacency or dissonance, providing assurance that a strong brand is the primary solution for ensuring institutional acceptance. This creates a

DOWNLOAD THE BOOK PROPOSAL

propensity for the second construct, moral legitimacy, to be both unaddressed and unexplored by most institutions.[511]

Moral legitimacy grants acceptance when stakeholders perceive an organization's actions as aligned with widely held values and norms about appropriate conduct.[512] Unlike pragmatic legitimacy, which asks whether an institution creates value, moral legitimacy asks whether it behaves with integrity. Stakeholders are not simply evaluating outcomes. They are judging whether the institution is reliable, predictable, and acts in ways that are considered appropriate. Different stakeholder groups apply this judgment through different lenses. Regulators emphasize compliance with legal frameworks while considering broader societal expectations. Employees often evaluate organizations through moral concerns such as care, fairness, and respect. Investors look beyond financial performance, searching for signals of integrity that reveal risks not yet reflected on the balance sheet. Communities, customers, and advocacy groups each apply their own expectations based on the relationship they have with the institution. Integrity, therefore, is not merely a matter of ethics. It is the

perception that an institution can be relied upon to behave consistently within the moral and legal expectations of its stakeholders. Organizations earn moral legitimacy when stakeholders believe that consistency exists. They lose it when actions become unpredictable, inconsistent, or misaligned with those expectations.

The acquisition of Twitter, now known as X, provides a useful case study in how rapidly changing behaviors can challenge moral legitimacy.[513] The transition in leadership disrupted many stakeholders' expectations regarding fairness, consistency, transparency, and appropriate corporate governance. While some viewed the changes as necessary to restore free expression and improve organizational efficiency, others interpreted them as departures from established norms. The result was not universal condemnation, but increased contestation over what behaviors were considered appropriate. Large-scale layoffs conducted over a compressed period were widely perceived by many stakeholders as abrupt and lacking sufficient regard for employee stability.[514] At the same time, significant changes to content moderation policies,

including the reinstatement of high-profile accounts such as Donald Trump, led many to question whether executive authority was being exercised in a predictable and consistent manner.[515] Regardless of whether these decisions were ultimately viewed as beneficial or harmful, they altered stakeholder perceptions of the institution's integrity. In doing so, they weakened moral legitimacy among important stakeholder groups by increasing uncertainty about how the platform would behave in the future.

As expectations became less predictable, segments of the user base reduced activity or disengaged. Independent estimates suggest that U.S. daily active users declined by roughly 20 to 25 percent in the period following the acquisition.[516] This shift was not universal, but it was directionally meaningful in one of the platform's most commercially important markets. Advertiser response followed a similar pattern. In the two years surrounding the acquisition, advertising revenue declined from approximately $4.5 billion to roughly $2.2 billion.[517] The contraction reflected a

broader reassessment of platform stability, brand safety, and governance. Unlike the TikTok examples, the performance and operational capacity of X remained largely intact, but perceived alignment with stakeholder expectations weakened. In this context, reputation did not deteriorate because the platform faced functional challenges. It deteriorated because the system responsible for signaling consistency, fairness, and accountability came under strain. This example illustrates a broader principle. When moral legitimacy is contested, even in the presence of continued utility, institutional acceptance can narrow. Reputation, in this sense, is not a layer on top of performance. It is a condition for its continued acceptance.

This pattern is not confined to a single company or moment. It reflects a broader progression in how institutions are judged in the Reputation Era. When moral legitimacy weakens, it does more than invite immediate scrutiny. It interrupts the longer journey toward the most durable form of acceptance, cognitive legitimacy.[518] Cognitive legitimacy can emerge when sustained acceptance, familiarity, and institutional embeddedness make an organization's role increasingly taken for granted. At this stage, stakeholders no longer continually evaluate whether an

[518] *Zimmerman, M.A. and Zeitz, G.J. (2002) Beyond Survival Achieving New Venture Growth by Building Legitimacy. Academy of Management Review, 27, 414-431. - References—Scientific Research Publishing*. (n.d.). Retrieved July 8, 2026, from https://www.scirp.org/reference/referencespapers?referenceid=2072825

organization deserves to exist. Its role becomes taken for granted. Questions of acceptability fade because the institution has earned something far more valuable than public approval. It has earned the benefit of the doubt.

This is reputational equity. Unlike brand equity, which increases preference, reputational equity increases resilience. It allows organizations to absorb mistakes, withstand scrutiny, and recover from setbacks that might otherwise threaten their license to operate. This is the business solution that reputation provides. Through the consistent delivery of prosperity and integrity, reputation accumulates legitimacy until acceptance becomes durable rather than conditional. That is the strategic value of reputation, creating an institutional asset that brand alone, on its own, cannot create.

Cognitive legitimacy should not be confused with invincibility. It endures only as long as stakeholders lack a compelling reason to reassess the institution. When significant societal consequences emerge or perceived moral violations occur, organizations become visible again. Corporate image fractures, cognitive legitimacy erodes, and stakeholders return to evaluating the institution through pragmatic and moral legitimacy. This is the defining tension of the Reputation Era. Cognitive legitimacy is

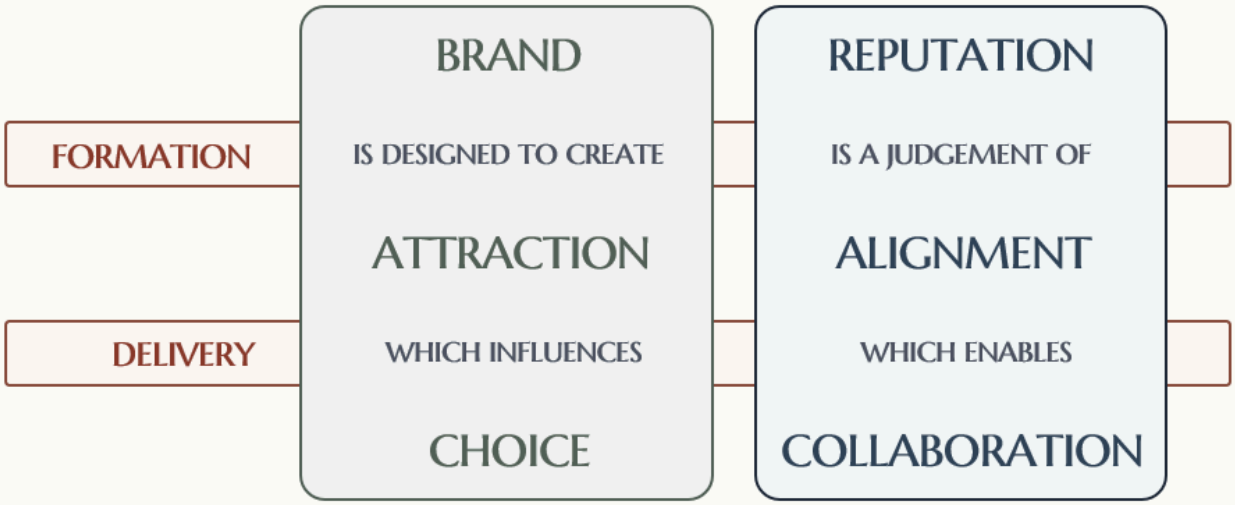
DOWNLOAD THE BOOK PROPOSAL

eroding faster than institutions can rebuild it. As the societal consequences of corporate scale become more visible, scrutiny intensifies and stakeholder skepticism grows. Fragmented information ecosystems make shared narratives about prosperity and institutional benevolence increasingly difficult to sustain. Even capitalism itself, once largely taken for granted, now faces renewed questions about its legitimacy.[519] As a result, institutions are once again required to answer fundamental questions. Why should you exist? What are your incentives? Who benefits? Who bears the costs? What are you hiding? The Reputation Era has returned modern institutions to a continual process of pragmatic and moral evaluation.

Tracing the path from legitimacy to reputation reveals a critical distinction. Reputation is not positioning. It is an external judgment of whether institutional behaviors align with stakeholder expectations of prosperity and integrity. Brand, by contrast, is a tool for choice. It solves marketplace problems through differentiation and preference. Reputation solves a fundamentally different problem. It answers the question of whether an institution deserves acceptance. Once this distinction becomes clear, both concepts become stronger. Brand management can focus on creating marketplace influence rather than carrying the burden of sustaining institutional

[519] Milanović, B. (2021). *Capitalism, alone: The future of the system that rules the world* (First Harvard University Press paperback edition). The Belknap Press of Harvard University Press.

legitimacy. Reputation, freed from brand's conceptual shadow, can emerge as a discipline in its own right, supported by its own infrastructure, measurement, and strategic purpose. Its role is to secure and sustain cognitive legitimacy by maintaining acceptance across both pragmatic and moral dimensions. Legitimacy therefore becomes the measure of reputational equity.[520] It is the institutional asset that provides resilience, earns the benefit of the doubt, and ultimately grants an organization permission to operate.



The separation of reputation from brand matters because institutions can no longer rely on brand desirability alone. As the societal consequences of corporate scale become increasingly visible, scrutiny forms more quickly and stakeholder expectations

DOWNLOAD THE BOOK PROPOSAL

are becoming harder to satisfy. Success in the Reputation Era depends on earning moral legitimacy, reducing reputational debt, and steadily building collaborative equity. Institutions that understand this will be better equipped to answer difficult questions about incentives, governance, and consequences with accountability and integrity rather than marketing claims. They will earn the benefit of the doubt when uncertainty arises and strengthen the legitimacy that sustains their license to operate. Those that fail to do so will face escalating scrutiny and cascading legitimacy challenges. The institutions that thrive in the Reputation Era will not be those with the strongest brands. They will be those with the strongest reputational alignment. That is the business case for reputation as an independent institutional strategy.

Passage 21: Clarity, Not Consensus

Summary Text (Not Included in Final Copy): Separating brand from reputation is not an academic exercise but a practical necessity. Brand is a system designed to create choice through differentiation and preference, while reputation is a system of collaboration earned through stakeholder judgment of alignment and legitimacy. Without recognizing reputation as an independent construct with its own

infrastructure, metrics, and strategy, organizations will continue treating it as a reactive communications function rather than a proactive system for preventing legitimacy challenges before they emerge.

While there is a definitive case for separating brand and reputation, in the end, it may be something of a fool's errand. This chapter presents multiple reasons why the two became conflated long before the Reputation Era. Realistically, the debate over what precisely defines each will likely persist without concrete unified resolution, for the foreseeable future anyway. As business needs, stakeholder expectations, technology, and broader societal systems continue to evolve so too will brand and reputation thinking. Another reason why a perfectly clean distinction between the two may remain elusive is because they share a good deal in common. They both influence trust, they rely on promises and expectations, and they translate perceptions into key business outcomes. Even deeper, at the core of their common ground, is their intangible nature, existing in people's minds.

This overlap is durable. Separating the two requires more than a new definition; it requires rethinking the assumptions that have connected them for decades.

DOWNLOAD THE BOOK PROPOSAL

This means that a path for conflation and perceived equivalence will remain as a continual challenge for institutional leaders. The understanding that brand and reputation solve uniquely different problems may never gain full consensus from industry leaders and academics, but it will, at the least, provide the clarity that each concept needs to sustain its own infrastructure. Brand should be viewed as a tool that helps institutions create meaning, differentiation, and preference.[521] While reputation should be viewed as helping institutions earn legitimacy and collaboration.[522] The outcomes of each offer a distinction that creates clarity, even if the pathways to achieving these outcomes remain deeply interconnected, contested by different points of view, and far from a groundswell of consensus.

It is not only their common ground that complicates matters, but also the intrinsic relationship between them. A strong reputation can make a brand more attractive by increasing stakeholder confidence and trust. Likewise, a strong brand can reinforce reputation by helping an organization create products and

DOWNLOAD THE BOOK PROPOSAL

experiences that generate prosperity. Each has the capacity to strengthen the other. Yet this relationship should not be mistaken for equivalence. Brand and reputation do not move in lockstep. A company with a strong brand is not guaranteed to have a strong reputation, nor does a strong reputation ensure marketplace success. Rather, the two exist in a reciprocal relationship. Strength in one can reinforce the other, while weakness in one can leave the other increasingly vulnerable.

While brand and reputation share several points of commonality, the signals they provide are fundamentally different. Each informs a different strategic question, solves a different business problem, and therefore deserves its own management approach. The distinction becomes clearest when each concept is understood by the role it serves. Brand management influences choice through differentiation, recognition, identity, and preference.[523] It shapes how an institution is understood in the marketplace and why stakeholders choose one offering over another. Reputation, by contrast, governs judgment. It reflects how stakeholders evaluate an institution's integrity by observing its behaviors,

communications, incentives, governance, and societal outcomes.[524] Where brand seeks to generate attraction, reputation seeks to secure stakeholder alignment. The two complement one another, but they should not be managed as though they are the same discipline.

To provide a more practical way of distinguishing the two concepts, brand can be understood as a system of tools designed to influence choice through five primary mechanisms. It differentiates offerings from competitors, creating distinctive space in the marketplace.[525] It shapes choice by influencing preference, consideration, purchase intention, and loyalty.[526] It builds recognition through awareness, salience, and top-of-mind recall, making the brand easier to retrieve when alternatives are evaluated.[527] It constructs consumer and product identity, creating emotional and symbolic connections that extend beyond

functional benefits.[528] Finally, it reinforces those associations through experiences expressed visually, verbally, and sensorially, making the brand memorable and meaningful.[529]

These five mechanisms operate as an integrated system. Brand management intentionally designs and coordinates each, continually adapting positioning, messaging, identity, and experience to changing market conditions and consumer preferences. Crucially, each of these mechanisms produces measurable outcomes. Differentiation can be tracked, preference quantified, awareness monitored, identity tested, and experience evaluated. Because these mechanisms could be measured, brand became institutionalized early.[530] Legal protections, accounting standards, trademarks, visual identity systems, licensing, and dedicated marketing functions gave brand the institutional infrastructure needed to evolve from an intangible concept into a recognized business discipline. Reputation lacks this foundation. It's missing a common vocabulary,

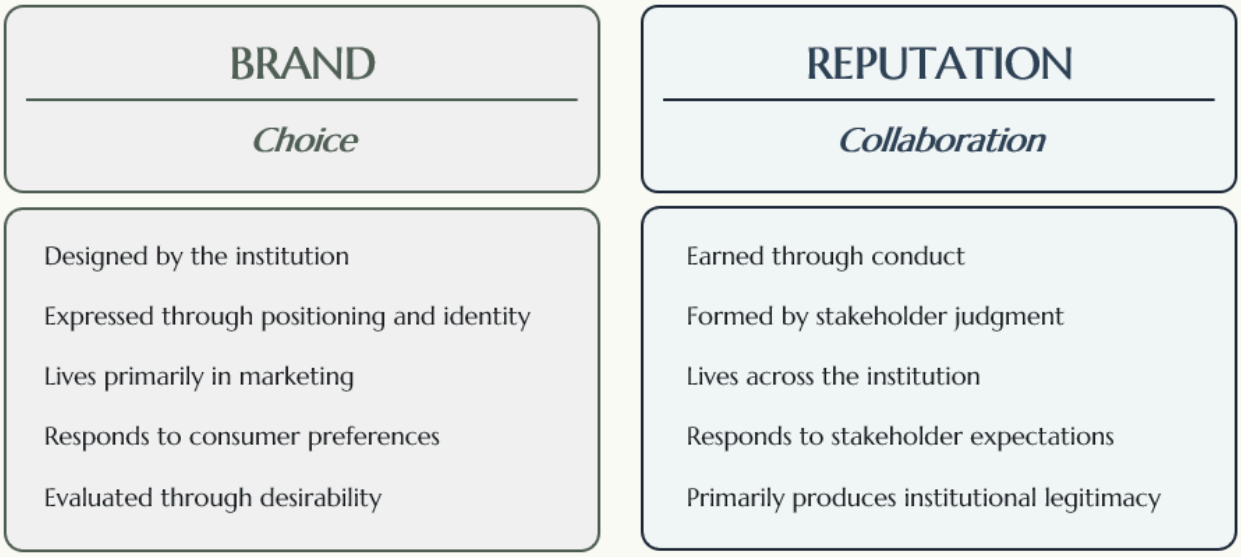
standardized metrics, formal governance, and organizational authority.[531] As a result, brand became the dominant framework for managing institutional perception, while reputation conceptually fragmented and organizationally orphaned.



To provide similar clarity, reputation should be understood as a system of collaboration. Unlike brand, it cannot be designed, claimed, or owned by the institution itself. It is earned through stakeholder judgment[532] and serves as the primary mechanism through which legitimacy is granted[533]. Reputational

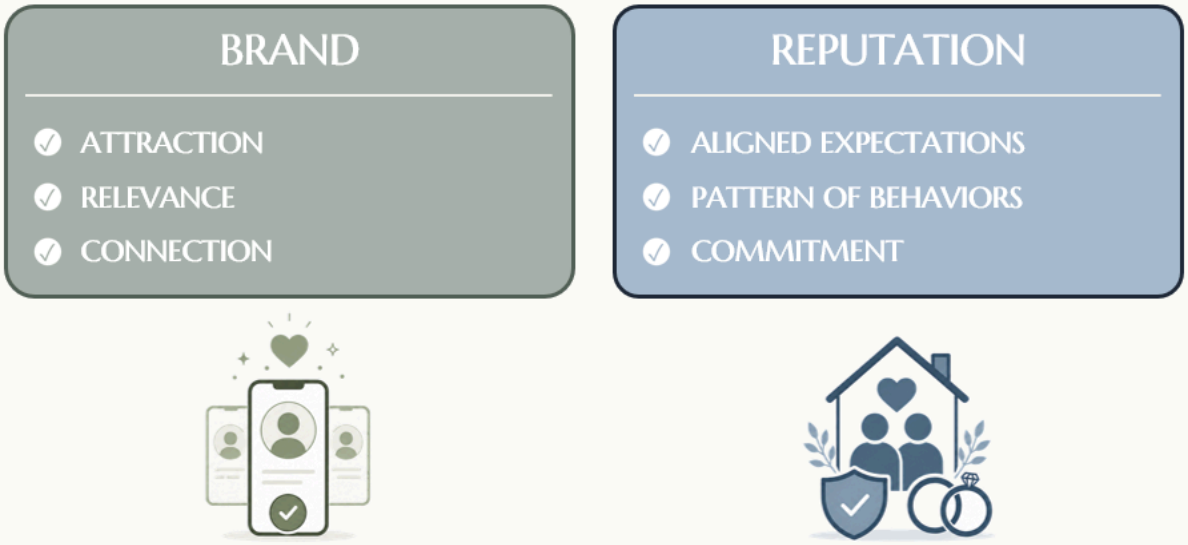
judgments emerge gradually as stakeholders observe patterns of behavior and assess whether an institution's decisions, conduct, communications, incentives, and governance consistently align with their expectations. Because those judgments extend beyond consumers to employees, regulators, investors, communities, policymakers, and other stakeholders, reputation exists across the entire enterprise rather than within a single function. This makes reputation inherently more complex, slower to influence, and difficult to standardize because stakeholder expectations vary across industries, business models, geographies, and stakeholder groups.

Brand and reputation are not the same thing, and these images illustrate the distinction in its simplest form. Brand cuts through a noisy marketplace by creating attraction, relevance, and choice. It is like an outfit, cosmetics, or a prestige car. It helps something stand out. Reputation operates differently. It is built through aligned expectations and consistent patterns of behavior to sustain legitimacy.[534] It is less concerned with appearance than with predictability, reliability, and expectation alignment. It answers a different question entirely, “Will this person do what they promise they will do?” A personal brand may generate success on a dating app, but

[534] Directory, S. (n.d.). *Institutional Legitimacy Crisis → Term*. Climate → Sustainability Directory. Retrieved July 9, 2026, from https://climate.sustainability-directory.com/term/institutional-legitimacy-crisis/

long after attraction has done its job, it is the reputation that earns the cognitive legitimacy required for a lifetime commitment. Simply put, a weak brand may make it harder to get a date, but a weak reputation is usually why the relationship ends.



While these illustrations intentionally oversimplify the distinction, the reality is that brand and reputation remain deeply interconnected. That interconnectedness helps explain why reputation measurement has remained both contested and confused. As reputation emerged as a formal discipline decades after brand management, it naturally inherited many of brand's concepts, assumptions, and measurement approaches. This legacy is still visible today. Many widely used reputation frameworks evaluate dimensions such as innovation, product quality, financial performance, momentum, and

DOWNLOAD THE BOOK PROPOSAL

leadership.[535] While these measures provide valuable insight into how stakeholders perceive an institution, they also reflect the long-standing conflation of reputation with brand and organizational performance. From Top 100 reputation rankings to syndicated customer datasets and executive scorecards, many measurement systems continue to evaluate legitimacy, brand strength, and business performance simultaneously.[536] The result is a reputation construct that often measures several different phenomena all at once, making it difficult to distinguish stakeholder acceptance from marketplace preference or organizational success.

This is where viewing reputation as the determinant of legitimacy brings both conceptual clarity and a practical foundation for measurement. Rather than asking whether stakeholders prefer an institution relative to its competitors, it asks whether stakeholders believe the institution continues to operate in ways that align with their expectations. The question shifts from choice to acceptance. That shift changes how reputation should be measured. Instead of

DOWNLOAD THE BOOK PROPOSAL

comparing marketplace performance against competitors, executives should measure the distance between stakeholder expectations and institutional behavior. Success is no longer defined by outperforming rivals, but by closing stakeholder alignment gaps. This distinction allows both disciplines to focus on the problems they are designed to solve. Brand measurement evaluates attention, differentiation, and preference relative to competitors. Reputation measurement evaluates stakeholder alignment, legitimacy, and the institution's capacity to sustain collaboration. Reduced to a single word, brand is choice. Reputation is collaboration.

The distinction between choice and collaboration may appear subtle, but its consequences are significant. For much of the twentieth century, organizations could rely on brand-led strategies because pragmatic legitimacy granted through brand delivery was often sufficient. Strong products, economic growth, innovation, employment, and shareholder returns generally secured stakeholder acceptance, or at least kept reputation risk minimized. Legitimacy faced less sustained public contestation largely because the societal consequences of corporate scale remained largely out of view. In that environment, the overlap between brand and reputation was manageable. This no longer works in the Reputation Era, a time where highly

DOWNLOAD THE BOOK PROPOSAL

consequential events, such as the 2008 financial crisis, arrive with clear visibility and comprehension. It leads to institutions being judged on more than just what they produce, to include how they operate, who benefits, who bears the costs, and whether their conduct remains aligned with evolving social expectations. These questions cannot be answered through positioning, messaging, or preference-building alone, they can only be answered through reputational efforts that build collaboration.

This is why the continued conflation of brand and reputation has become increasingly costly. When legitimacy challenges emerge, organizations often respond with the tools they know best, brand campaigns, messaging, narratives, and demonstrations of product competence. Yet legitimacy cannot be communicated into existence. It is earned through continual behavioral alignment against stakeholder expectations. When institutions attempt to solve stakeholder judgment problems with marketplace tools designed to influence choice, they often widen the gap between what they promise and what stakeholders experience. In doing so, they create the very conditions that weaken their own legitimacy.

DOWNLOAD THE BOOK PROPOSAL

Separating brand from reputation is therefore not an academic exercise or merely a definitional debate. It is a practical necessity for institutions seeking to earn societal acceptance and sustain collaboration. Reputation must be recognized as an independent discipline because it solves a fundamentally different business challenge. Without that distinction, it cannot justify dedicated infrastructure, measurement, strategy, or organizational authority. Until then, reputation will remain a reactive function, activated after crises emerge rather than designed to prevent them. It will continue to be treated primarily as a communications activity, managed through narratives, stakeholder messaging, and performative signals instead of systems that identify and close stakeholder expectation gaps before they become legitimacy challenges.

This limitation becomes increasingly consequential as the defining conditions of the Reputation Era intensify. Corporate consequences are becoming more visible, while stakeholder expectations continue to shift alongside changing markets, politics, and social norms. Perceived moral violations spread rapidly through fragmented information ecosystems. In this environment, reputation can no longer be treated as a communications outcome or a byproduct of brand strength. It must be understood as a management system for securing legitimacy and sustaining collaboration.

DOWNLOAD THE BOOK PROPOSAL

Institutions that recognize this shift will be better positioned to prevent legitimacy challenges before they become reputational crises, adapting business practices before the rules arrive. Those that do not will find themselves responding to an endless cycle of legitimacy challenges with tools that were never designed to solve them.

Bringing the Reputation Architecture Together

Corporations were built. Brands were designed. Institutions were created. Predating all these inventions, long before they were conceived, lies reputation. Reputation is not a new concept. What is new is our understanding of its underlying mechanics and how consequential they have become in the Reputation Era. Expanding corporate power, technological acceleration, fragmented information systems, and rising stakeholder expectations have made institutional behavior more visible, more interpretable, and more vulnerable to scrutiny. A human mechanism originally used to assess predictability, reliability, and the conditions for collaboration now operates at institutional scale, shaping whether organizations are accepted, resisted, trusted, constrained, or rejected.

The system always begins with signals. Institutions are evaluated through their actions, consequences, stories, symbols, leadership decisions, and observable patterns of

conduct. These signals are messy. They rarely arrive complete or in orderly form. They travel through gossip, media, advocacy, lived experience, cultural narratives, and increasingly fragmented and polarized information environments. To travel, complex stories are compressed into symbols, heuristics, and labels that form durable impressions. Individual signals may fade, but repeated patterns of behavior shape an institution's image.

Signals, however, carry no stable meaning without interpretation. Stakeholders rely on three recurring lenses of judgment to determine how they will evaluate and engage with an institution: Integrity, Prosperity, and Desirability. Integrity asks whether conduct is predictable, reliable, and aligned with moral expectations. Prosperity asks whether the institution creates value and contributes to broader well-being. Desirability asks whether it offers something people want, prefer, or identify with. These lenses are distinct but not fully sealed from one another. Their boundaries are semi-permeable, and the same signal may influence more than one form of judgment. The purpose of the Reputation Architecture is not to produce perfect consensus, but to create enough clarity to distinguish the mechanisms through which the reputation operating system works.

DOWNLOAD THE BOOK PROPOSAL

As judgments accumulate, they form and continually reshape institutional images. Although often confused, brand and reputation are not interchangeable. They are separate mental constructs shaped primarily by different signals and evaluated through different criteria. Brand is most closely tied to desirability and choice. Reputation is more closely tied to integrity, prosperity, and the willingness to collaborate. The two can reinforce one another, weaken one another, and occasionally overlap, but consolidating them within a single strategy or organizational infrastructure obscures the distinct problem each is meant to solve.

Once an image is established in a stakeholder's mind, consequences follow. Those images directly influence the legitimacy granted to the institution. Stronger and more coherent images can support moral, pragmatic, and cognitive legitimacy, while weaker, fractured, contradictory, or inconsistent images can produce skepticism, resistance, and withdrawal. Legitimacy is therefore not an abstract endorsement. It is the mechanism through which institutions are granted permission to belong, operate, influence, and endure. In a polarized environment, that acceptance is neither automatic nor permanent. It must be continually renewed through signals that remain coherent with stakeholder expectations.

DOWNLOAD THE BOOK PROPOSAL

The Reputation Architecture that follows brings these mechanisms into a single system. Signals are judged. Judgments form images. Images shape legitimacy. Legitimacy produces institutional acceptance. Acceptance enables collaboration. From that collaboration flow two outcomes institutions value but cannot manufacture directly: resilience and influence. As legitimacy is continually earned, institutions may also receive trust, forgiveness, loyalty, advocacy, authority, preference, and the benefit of the doubt. The full Reputation Architecture is more complex than any single sequence can capture, but its central logic is clear. Reputation is not an isolated perception or communications outcome. It is the system through which institutional conduct is interpreted and converted into the collaboration required to operate at scale.

Section 3: The Anatomy of Corporate Reputation

Reputation as a Dynamic System of Systems

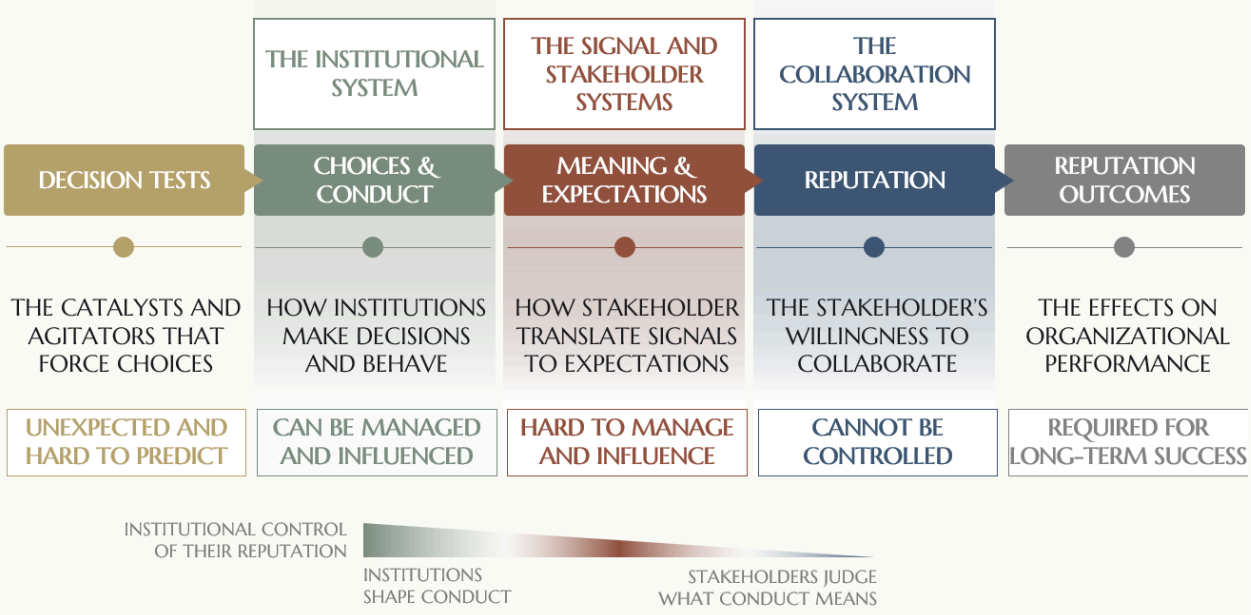
Reputation is complicated because it emerges from several systems working together. Yet leaders often try to place it neatly into boxes, scores, and dashboards. That impulse is understandable. Measurement helps institutions monitor reputation and make decisions about where to focus their attention and resources. It also helps justify the resources and infrastructure it needs. But a score cannot, by itself, explain how reputation moves from institutional conduct, through signals and stakeholder judgments, to collaboration and its consequences. Without that context, leaders may know what the number is but may not understand what it represents, what is driving it, or what responses should be considered.

Reputation's anatomy is made up of three connected systems. The institutional system is where values, authority, incentives, and decisions shape how an institution behaves. The signal and stakeholder system is where that conduct becomes visible, travels through the wider environment, and is interpreted against stakeholder expectations. The collaboration system is where those expectations meet those signals in judgments which influences whether stakeholders are willing to support, enable, or constrain the institution.

DOWNLOAD THE BOOK PROPOSAL

These systems do not operate in isolation, they are constantly confronted by external forces that push institutions into decision tests. What the institution decides shapes conduct, that conduct produces signals, and stakeholders interpret those signals through expectations formed by experience and context. Stakeholder behaviors then enable an institution to build influence and resilience, or it can create friction and constraint. How stakeholders respond can impact the performance of an organization.

The Reputation Outcomes Institutions Seek is the Result of a System of Systems



For simplicity, this dynamic process can be represented as a linear model. The model makes reputation's core elements and their connections easier to see, but it cannot capture the full complexity of how they interact. The next three chapters examine the forces within this system more closely, showing how expectations take shape, how

DOWNLOAD THE BOOK PROPOSAL

signals gather momentum or remain dormant, how stakeholders react to signals, and the challenges of quantifying the value and impact reputation has on long-term institutional performance.

Chapter 7: Coding Organizational Behavior

Quote Text (Placed on the section break page): *"It's not hard to make decisions once you know what your values are." — Roy E. Disney of the Walt Disney Company*

Passage 22: Values, the Compass for Choice and Conduct

Summary Text (Not Included in Final Copy): Institutional values matter only when they move beyond aspiration and shape how an organization makes difficult decisions. Stated values create expectations, while enacted values are revealed through the conduct those decisions produce. When values are embedded in systems, incentives, authority, and consequences, they can guide behavior, reinforce culture, and make future conduct more predictable. Their benefits are often undervalued because the costs of honoring them are immediate, while the gains in trust, collaboration, resilience, and legitimacy accumulate over time. The section therefore tests values at

DOWNLOAD THE BOOK PROPOSAL

two levels: whether each value is operationally useful and whether the complete values architecture can produce Conduct, Practice, and Resonance.

Institutions continually make decisions about where to invest, what to prioritize, which interests to protect, what standards to uphold, and which tradeoffs they are willing to accept. Most of these decisions attract little attention. Others reveal what an institution values most, because competing obligations, incomplete rules, external pressure, or meaningful costs force it to show what it will actually prioritize.[537] Those are the moments when its behavior is placed on display for stakeholders to observe and judge. The meaningful unit of analysis is therefore not what an institution says it values, but the choices it repeatedly makes when honoring those values carries a cost, and it is in those moments that reputation is commonly earned or lost.[538]

This reveals one more important distinction between brand and reputation. Across the vast landscape of brands, from the past, present day, and well into the future, they all have one thing in common. They are created. Reputation, by contrast, is

[537] Kaptein, M. (2011). Understanding unethical behavior by unraveling ethical culture. *Human Relations*, *64*(6), 843–869. https://doi.org/10.1177/0018726710390536

DOWNLOAD THE BOOK PROPOSAL

commonly derived from choice and conduct.[539] The distinction matters because institutions have far greater control over the signals used to construct a brand than they do over the judgments that eventually become their reputation. This is because reputation develops as stakeholders observe what an institution repeatedly does and determine whether its behavior was aligned with what they believe it should have done.[540] It is established much less by what the institution claims to be, more so from the patterns of conduct which reveal what it actually is.

Those patterns become most visible when decisions are difficult. When obligations are clear, incentives are aligned, and the cost of doing the right thing is low, institutions are better positioned to appear principled. The more revealing moments occur when priorities compete and satisfying one obligation requires compromising another. Consider the decision to disclose information that could damage stock performance, protect the voice and integrity of a whistleblower even when doing so may trigger a crisis or leadership change, or delay a profitable product launch to conduct another round of safety testing. These are decision tests. They expose institutions to choices

DOWNLOAD THE BOOK PROPOSAL

for which there may be no costless answer and force competing priorities to be reconciled. What matters is not simply the outcome of the decision, but the principles used to reach it. It is at these points that abstract commitments become operational choices and values begin to function as guardrails for conduct.

This is where institutional values, as guardrails for conduct, enter as another facet that separates reputation from brand strategy. These values are not simply expressions of organizational character or language intended to inspire employees or connect with customers. They are principles meant to guide judgment when an institution must choose among competing priorities.[541] When values consistently shape decisions, they produce patterns of conduct that stakeholders can observe, interpret, and eventually use to assess the reliability of the organization and predict its future behavior.[542] When they do not, the distance between what the institution says and what it does becomes evidence of a deeper misalignment.[543] Values therefore matter to reputation not

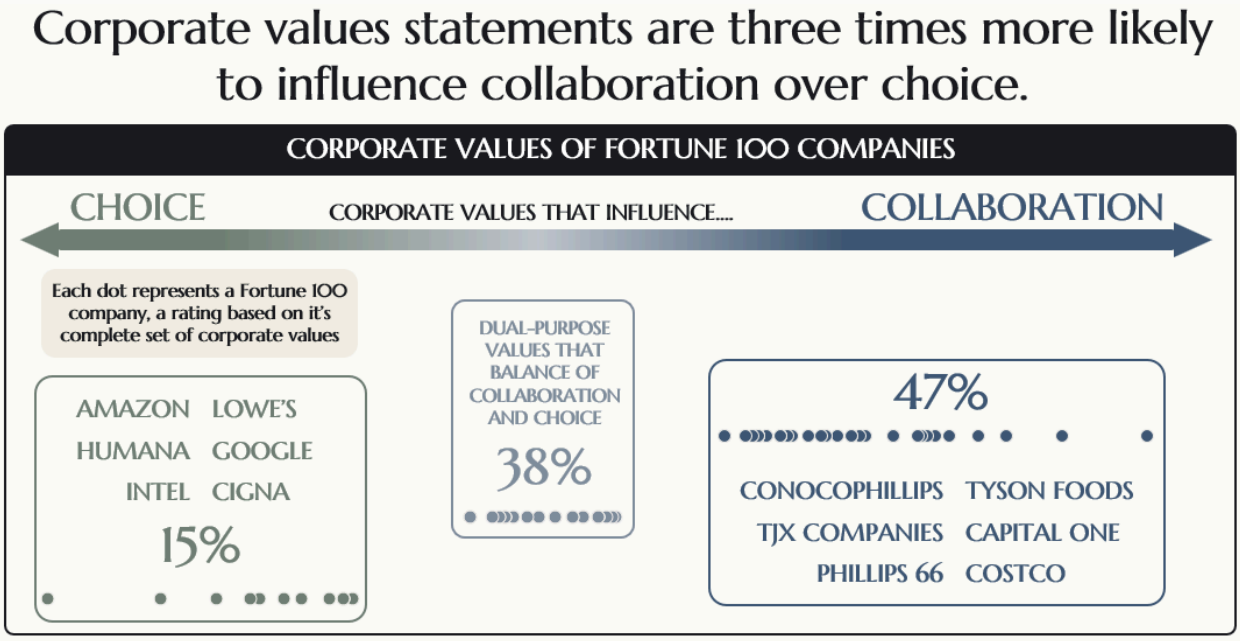
because they describe an institution's future aspirations, but because they influence the conduct through which its legitimacy is continually earned or lost.



As a general practice most institutions publish values, as a means of outlining what conduct should "look like". Far fewer reinforce these values with systems that enable them to become a consistent practice. Even less specifically outline what those values are supposed to accomplish.[544] A review of the stated values of Fortune 100 companies reveals that organizations tend to place very different kinds of ideas under the same label.[545] Some values establish ethical standards, while others reinforce

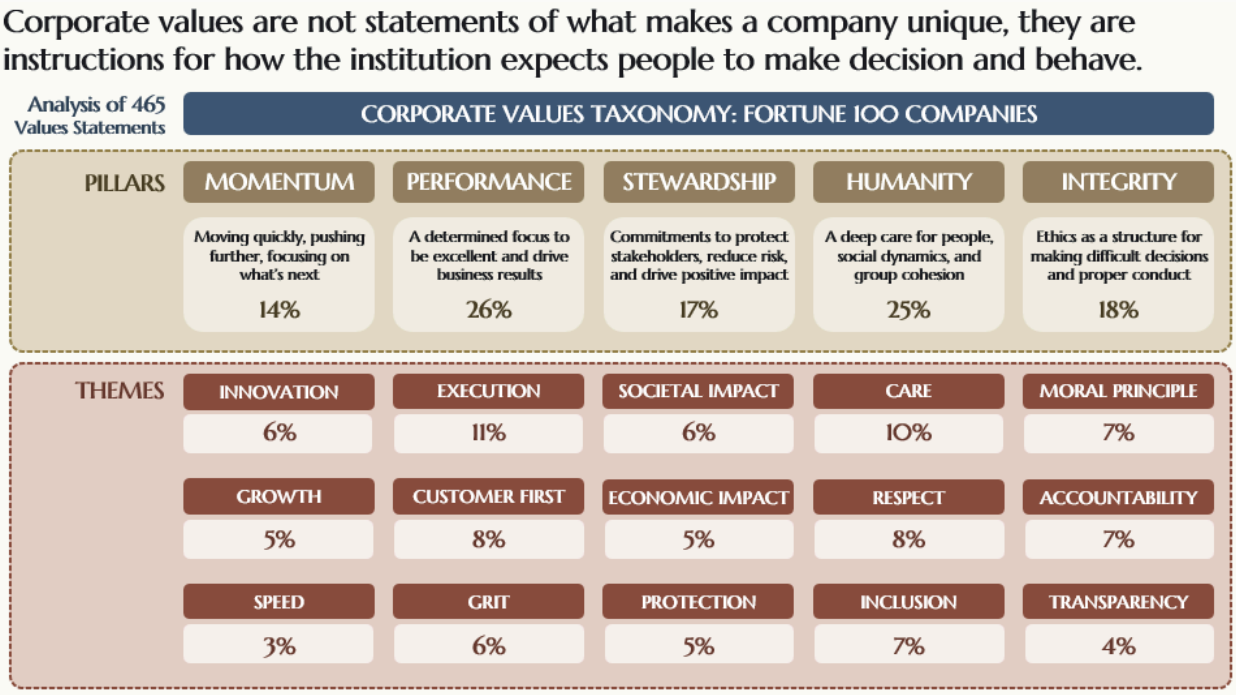
DOWNLOAD THE BOOK PROPOSAL

investments in people, some elevate the importance of societal and economic prosperity, while others encourage performance and innovation. More than six out of ten Fortune 100 companies were found to display values statements that include the word integrity, making it one of the most common terms. But corporate values were not limited to morals, ethics, accountability and transparency; other key themes included momentum, performance, stewardship, and care for human well-being surfaced as well.



The problem is not that cultural, aspirational, or performance-oriented values are inherently wrong, nor is it necessarily that these companies selected the wrong values.

DOWNLOAD THE BOOK PROPOSAL

The problem is that institutions often fail to specify what job each value is expected to perform.[546] Some values could be intended to establish moral boundaries in decision making. Some may be intended to set standards for performance, or express the kinds of obligations the company holds beyond making a profit. When these distinctions remain unclear, employees are left to determine which value should govern a difficult decision, how competing values should be reconciled, what behavior best demonstrates the value, and whether the value has been enacted at all.[547] Functional ambiguity turns what should be a source of guidance into another layer of interpretation, commonly at times when clarity is needed most.

Institutional values exist in two forms, stated values and enacted values. An institution's stated values express what it publicly claims to prioritize, while enacted values are revealed through its decisions and conduct. The common fault point lies in the belief that publishing a stated value makes it operational. Publishing a value creates a standard for judgment, but it does not guarantee that the institution will model the behavior it describes.[548] Once an institution claims integrity, safety, fairness,

transparency, respect, or customer commitment, stakeholders can use that claim to interpret what follows. When stated and enacted values align, they can strengthen reputation by making future conduct more predictable and repeatable.[549] When they conflict, the stated value may work against the institution by making the inconsistency more visible.[550] This say-do gap becomes especially consequential when leaders fail to demonstrate the value, employees are uncertain how to apply it, incentives reward contradictory behavior, or violations carry no consequences. The reputational problem is therefore not simply that the institution behaved poorly. It is that the institution established one expectation and then supplied evidence of a different lived reality.

Few examples illustrate this risk more clearly than Enron. Integrity was one of four values the company publicly elevated alongside respect, communication, and excellence, with the words reportedly displayed prominently in its corporate headquarters.[551] Yet the visibility and permanence of the statement did not make

integrity operational. Instead, the company fell into bankruptcy in 2001, and has since become synonymous with the term corporate fraud.[552] This contrast between the value Enron displayed and the conduct its own systems rewarded became an enduring symbol of performative values. Because many organizations, like Enron, have installed stated values without living them, the concept of institutional values tends to be viewed through a lens of cynicism as either being performative or moral theatre that distracts leaders from focusing on performance.[553] The lesson is not that values are meaningless, it is that their prominence can intensify reputational damage when institutional conduct does not align to the expectations the words themselves created.

Institutional values are guiding principles that an organization treats as non-negotiable priorities meant to guide conduct when rules are incomplete, incentives conflict, or decisions require judgment.[554] They do not replace law, policy, contracts, monitoring, incentives, or governance, but become essential where those

systems cannot provide a complete answer. No institution can write a rule for every situation employees will encounter or anticipate every technological shift, stakeholder conflict, competitive pressure, ethical dilemma, or crisis.[555] Values are most effective in scenarios where policy is lacking, priorities compete, economically attractive options create risk, responsibility is uneven or uncertain, consequences can be mitigated, and when leaders are forced to act quickly before all the facts are available.[556] They also enable social enforcement by teaching employees not only what is formally prohibited, but what colleagues and leaders will reward, protect, tolerate, or condemn. In this sense, values do not merely tell people what to believe. They create a common basis for judging conduct.[557]

From the outside, institutional values can look like website language or boilerplate communication. Their authenticity often remains uncertain until organizational choices bring them to life. According to management consulting firm Synergogy "A

stakeholders. While the tobacco decision does not resolve every tension between CVS's stated values and its operational practices, it does demonstrate a willingness to accept measurable commercial cost in service of a stated value, which is what drove institutional stakeholders to respond accordingly.

Values, when implemented effectively, are decision systems.[562] They can be used to determine how an institution allocates resources, designs products, hires and promotes employees, sets incentives, manages risk, discloses information, protects employee voice, enforces standards, creates accountability, assigns consequences, engages stakeholders, and handles a crisis.[563] An institution that claims to value protection, care, and transparency should be able to demonstrate that leaders disclose unfavorable information, employees can raise concerns safely, incentives discourage concealment, internal reporting effectively reaches decision-makers, messengers are protected, failures are investigated rather than hidden, and retaliation carries consequences. The relevant question is therefore deeper than whether people believe in the value. It is whether the value appears visibly in the institution's allocation

of power, resources, incentives, protection, and consequences.[564] Heather McCague, TITLE TO BE DEFINED, captures the institutional test clearly. "If a value can't influence who you hire, how you evaluate performance, or when you exit someone, it isn't operational. It's decorative."[565] Her point is not that values belong only to human resources. Hiring, performance evaluation, and termination are simply among the clearest moments when an institution demonstrates whether its stated values will become enacted values.[566] But the same test applies to product decisions, safety standards, customer treatment, resource allocation, crisis response, and leadership accountability. Values only become operational when they influence what the institution permits, rewards, protects, and is willing to give up.

The effectiveness of a values-driven governance architecture becomes most visible when an institution manages a situation that has the potential to spiral into crisis.[567] Fast-moving issues create decision tests where values cannot be invented or

embedded on demand. They must already be established and practiced before the test arrives, enabling action when information is incomplete, time is limited, and consequences are uncertain. Crisis prevention often requires rapid coordination, consequential tradeoffs, immediate costs, and decisions that exceed minimum legal obligations.[568] Leaders and employees must already understand whom to protect, which risks are unacceptable, what to disclose, who has authority to act, and what costs the institution will absorb. Consider Walmart's response to Hurricane Katrina in 2005. Local retail managers used delegated authority, operating culture, and logistical capabilities to move essential supplies, support employees, and respond to urgent community needs without waiting for headquarters to create instructions or a value hierarchy.[569] The larger lesson is that coherent values-driven conduct that responds to a fast moving threat is rarely created during the emergency. It is the visible outcome of values, authority, and culture established long before a crisis ever begins.

Walmart's response also demonstrates that a single decision, however consequential, does not by itself create culture. A value becomes cultural only when repeated patterns of choices and behaviors teach employees, and external stakeholders, what

the institution genuinely expects, rewards, protects, punishes, tolerates, or ignores.[570] Consider an institution that claims, "We tell the truth." When leaders disclose unfavorable information and protect the employee who raised it, stakeholders confirm their beliefs that candor is safe and valued. Problems are more likely to surface earlier, giving leaders better information and more time to intervene.[571] If leaders instead punish the messenger, employees learn that honesty carries personal risk. Concealment becomes rational, silence becomes the actual norm, and decision-makers receive incomplete information until the consequences become more severe.[572]

The process is therefore a recursive feedback loop. Stated values encounter decision tests, leadership choices produce conduct, repeated conduct establishes cultural norms, and those norms influence how future decisions are made.[573] Culture is not merely the endpoint of enacted values; it becomes a self-reinforcing system that

makes certain behaviors more likely and others less so.[574] It is shaped internally through leadership choices and serves as a guidepost that helps employees anticipate what the institution will reward, protect, tolerate, or punish.[575] Externally, repeated patterns of conduct allow stakeholders to anticipate how the institution is likely to behave when similar circumstances arise. This conduct predictability is one of the central reputational benefits of enacted values because it transforms isolated decisions into durable evidence of institutional character.

That institutional character is influenced by how well institutions form strong values and facilitates the choices and conduct to make them come alive.[576] But it is also the basis on which employees determine whether an institution's integrity is real. The 2026 Integral Index Report, produced by Integral, an employee experience and engagement consultancy, illustrates this relationship by examining five observable integrity behaviors.[577] The findings suggest that positive workplace cultures are not built around a single defining character trait. They emerge from employees' accumulated perceptions of whether the institution treats people fairly, takes their opinions into account, considers their well-being when making important decisions, keeps its promises, and delivers what it says it will deliver.[578] Culture, in this sense, is the lived expression of integrity focused values through repeated consistent conduct.

The value of predictable values-driven conduct and a strong workplace culture can be difficult to recognize because the costs of maintaining them are immediate and visible, while the benefits accumulate gradually, remain difficult to isolate, and often become most apparent when the institution needs them most.[579] Delaying a launch over safety concerns, disclosing damaging information, or refusing a profitable shortcut creates a measurable near-term cost to maintain an organization's values. The benefits of consistent, values-driven conduct emerge over time through customer trust, employee engagement, earlier risk detection, enhanced credibility, and reduced

political or regulatory friction, to name just a few reputation outcomes.[580] Together, these strengthen institutional legitimacy, influence, and resilience, even when their effects are difficult to measure. This creates a valuation asymmetry. The cost of honoring a value can appear quickly in quarterly reporting, while the benefits of values-driven conduct may take years to become visible. Leaders may therefore compromise their stated values because doing so appears economically rational.[581] As those compromises accumulate, say-do gaps emerge, reputation weakens, and legitimacy debt appears as distrust, disengagement, and scrutiny.[582] The institution will eventually pay a contradiction tax for these choices. What becomes evident, at this point, is that values always carry a cost. The question is when the organization will pay it, immediately by honoring its values or later by compromising them.

While the costs may be more evident, the benefits of values can be challenging to accurately quantify. Studies have found that their effects on financial performance are

Jamie Notter, a culture scientist who has led a career coaching institutional leaders on how to build strong cultures (www.jamienotter.com), points out that "leadership often struggles to see the patterns that shape and influence culture".[584] He further notes that, "organizations often embrace both the concepts behind their values and the values themselves. However, they place far less emphasis on putting in place the practices that make those values real."[585] The CPR framework responds to this problem by moving beyond the concept or wording of a value. It asks whether employees believe the value can guide conduct, whether the institution has the practices and systems needed to make it real, and whether the value resonates with employees, stakeholders, and the organization's direction. CPR is therefore not a measure of popularity or approval. It is a test of whether a value contains the elements necessary to influence behavior, become embedded in practice, and contribute to meaningful organizational outcomes.

Resonance in this case does not mean popularity, universal agreement, or satisfying every demand. Stakeholders often disagree about what an institution should do, and

their expectations may conflict.[586] The deeper purpose is to understand what stakeholders expect from the institution, including the choices it should make, the practices it should establish, and the outcomes it should pursue. The CPR framework therefore does more than test the quality of an institution's values. It also provides insight into whether those values effectively align with stakeholder expectations. Understanding how stakeholders expect an institution to behave before a decision needs to be made can be just as consequential as the values themselves.[587] Because values influence institutional choices and conduct, which are also judged externally, the effectiveness of values also depends on broader stakeholder expectations the organization is held accountable to. That raises a more fundamental issue, which is how stakeholders form those expectations in the first place.

Passage 23: The Science of how Expectations Form

Summary Text (Not Included in Final Copy): Stakeholder expectations exist long before a reputational crisis makes them visible. The VIPER Model explains how Values, Identity, Priors, Exposure, and Rules interact to shape the baseline standards

stakeholders apply to an institution. These constructs do not operate in a fixed sequence or carry equal weight in every situation, but together they help explain why different stakeholders may judge the same conduct in very different ways. Institutions therefore cannot manage reputation by searching for one universal expectation or assuming that every stakeholder views the organization through the same lens. Understanding the landscape of baseline expectations is the necessary first step before examining how new signals confirm, intensify, or change them.

Answering it begins with recognizing that stakeholder expectations form long before the moments of scrutiny or reputational crisis.[588] They exist beforehand as often-unspoken assumptions about what an institution should do.[589] Scrutiny is a downstream result of these expectation gaps.[590] As these gaps widen and become highly visible to an increasing number of stakeholders it activates constraints that can

restrict an institution's operations and challenge its legitimacy.[591] By this point, stakeholders are no longer simply expressing concern, they are actively working to restrict the institution's operations, influence, leadership, or scale. Institutional leaders may first become fully aware of stakeholder expectations at this stage, but the foundations were formed months or years earlier. These foundations tend to form along multiple key constructs,however, no single established model integrates them into a comprehensive account of how expectations form. Some research traces expectations to early socialization,[592] while other work shows that they emerge through experience, institutional roles, applicable rules, and exposure to consequences.[593]

While some institutional leaders mistakenly believe that stakeholder expectations suddenly form at the point of crisis; another popular notion is that they are purely personal or easily reduced to demographic categories.[594] While expectations may

sometimes correlate among groups with similar demographics, the process by which expectations form is far more complex. Baseline standards that stakeholders apply to an institution are commonly driven by several forces.[595] Across these literatures, expectations are consistently treated as the product of multiple interacting influences, but the evidence does not establish a fixed sequence in which one construct always precedes or outweighs another.[596] As a result, expectation formation does not follow a perfect scientific equation.

While a comprehensive model may be lacking, the individual relationships between these constructs and expectation formation are well established. In "Universals in the Content and Structure of Values: Theoretical Advances and Empirical Tests in 20 Countries," Shalom Schwartz shows how durable values organize what people consider important,[597] while later work on value instantiation explains why those priorities must be translated into concrete meaning before they can shape expectations of

institutional conduct.[598] Bruce Biddle's "Recent Developments in Role Theory" demonstrates that social positions carry expectations, helping explain why employees, investors, regulators, physicians, journalists, and customers apply different standards to the same institution.[599] Denise Rousseau's "Schema, Promise and Mutuality: The Building Blocks of the Psychological Contract" shows how prior beliefs, experiences, and perceived promises create expectations about what an organization owes those with whom it has a relationship.[600] Research on stakeholder dependence, vulnerability, and salience further indicates that expectations become more consequential when people face meaningful exposure and possess limited ability to protect themselves.[601] Finally, Cristina Bicchieri's "Behaving as Expected: Public Information and Fairness Norms"[602] and Mark Suchman's "Managing Legitimacy: Strategic and Institutional Approaches"[603] show how social norms and institutional standards define appropriate

conduct even when no explicit legal requirement applies. Taken together, the range of research on how expectations form makes one conclusion difficult to avoid. Baseline expectations are shaped through the interaction of multiple constructs rather than through any single source.

The strongest established findings from these bodies of work can therefore be assembled into a practical framework for understanding how baseline expectations form. Five constructs emerge as the primary influences. They are Values, Identity, Priors, Exposure, and Rules, or VIPER. No single construct is inherently dominant, and their boundaries often overlap as they interact. Identity may determine which values become salient, prior experience may influence how rules are interpreted, and exposure may intensify expectations attached to a stakeholder's role. The VIPER Model consolidates previously established constructs into a practical framework for explaining why different stakeholders approach the same institution with different assumptions about what it should do. It is not a predictive equation or a universal psychological sequence. It is a synthesis of a range of conditions and factors that shape stakeholder expectations.

DOWNLOAD THE BOOK PROPOSAL

The journey into how stakeholder expectations form begins at a brewery in Scotland. BrewDog built itself an image of being unconventional, anti-corporate, and powered by a community of employees, customers, and investors who saw themselves as part of something different.[604] That promise resonated because values help people decide what matters and what forms of conduct they are willing to accept. When an institution appears to share those values, stakeholders often convert them into expectations about how it will behave.[605] But in 2021, former BrewDog employees published an open letter under the name Punks With Purpose describing a culture in which rapid growth, speed, and founder ambition had come at the expense of employee well-being, leaving some workers feeling intimidated, expendable, and harmed by their experience.[606] The letter did not create the employees' expectations. Instead, it revealed expectations of dignity and fairness that had been present all along, which was strengthened by BrewDog's own promise to be a different kind of company. The letter was a response to a say-do gap, where employees believed

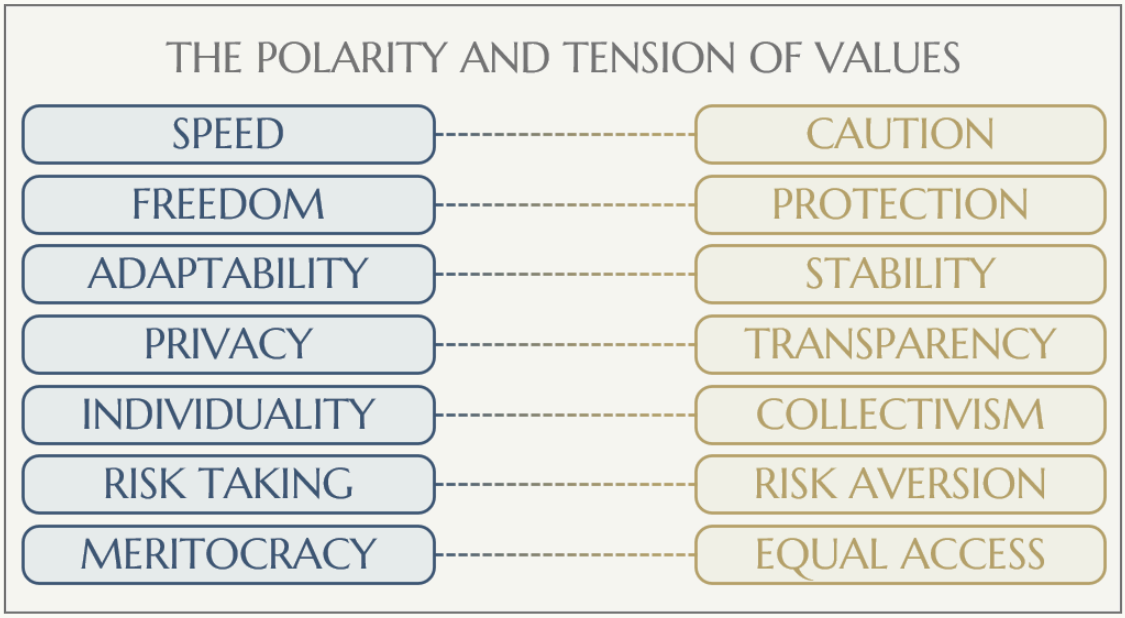
BrewDog had compromised their own institutional values, leading to the perception of a toxic culture. As the letter framed it, the problem was twofold. The company appeared to have fallen short of translating its stated values into consistent conduct, and it had not recognized that stakeholders had already turned those values into standards against which its conduct would be judged.

Values can open the door to contradictions. When behavior deviates from what was claimed, scrutiny is soon to follow.



Values offer insight into what matters to someone. Identity is different because it links relationships people have with others with what matters most to them.[607] It shapes

whom they stand with and the obligations they inherit from the groups to which they belong. An example that brings the Identity construct to life can be found in Sweden, where a fifteen-year-old stood outside parliament calling for a school strike to make a stand on climate change.[608] Greta Thunberg's protest expressed more than environmental concern. It embodied a generational identity built around the belief that young people would inherit the consequences of decisions made by institutions they were still too young to control or influence. The result was Fridays for Future, which became more than a global youth movement.[609] It offered an identity that others could recognize which quickly brought them into the tent. Once inside, that shared identity helped shape the expectations that formed within it. The movement called on governments and institutions to limit warming to 1.5 degrees Celsius, follow the Paris Agreement, act on climate science, and pursue climate justice.[610] What began as a personal identity became a collective one, and that collective identity became an organized expectation of institutional conduct. These collective identities extend far beyond environmental movements. They also take shape through investor

communities, labor unions, professional associations, and other stakeholder groups that forge shared institutional expectations.

Identity is a powerful construct because it does more than just create a center of gravity for movements and communities. It also influences how stakeholders receive and evaluate the signals around them.[611] People tend to place greater trust in information sources, institutions, and messengers they perceive as understanding or representing people like them.[612] While information that threatens a shared collective identity may be questioned, resisted, or interpreted through the beliefs of the group.[613] This phenomenon is also known as in-group dynamics, where the credibility of a signal depends partly on who delivers it, how it is framed, and whether accepting it would require stakeholders to reconsider something important about their own identity or the communities they belong to.[614] Identity therefore shapes not only the

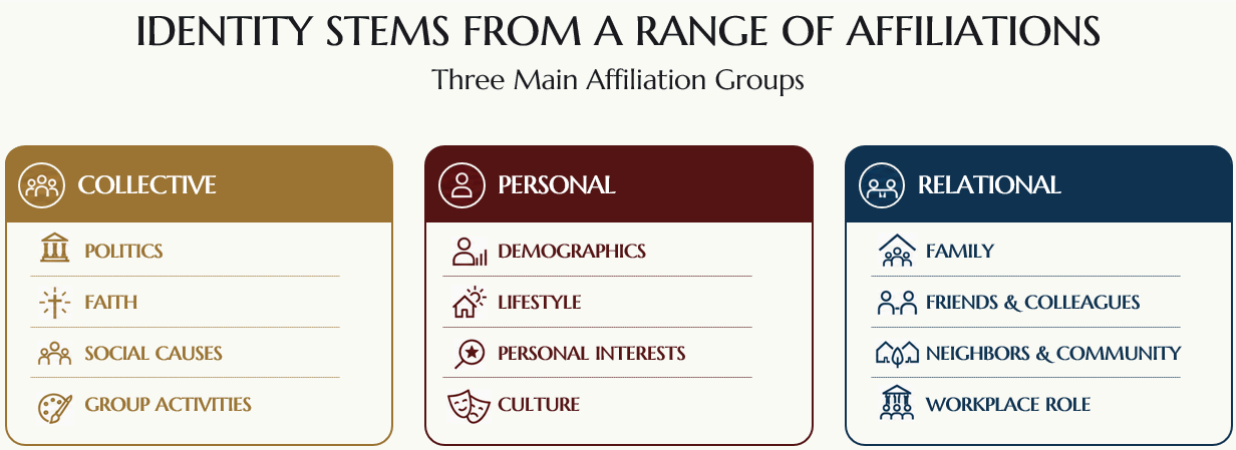
expectations stakeholders form, but also the information they use to confirm or change their expectations.



In many cases, expectations are difficult to change because prior beliefs can make baseline expectations "sticky."[615] These priors are the beliefs and accumulated experiences stakeholders continue to carry, often until a pattern of observable signals forces the expectation to evolve. Priors, fittingly, returns the journey to understanding how expectations form to Britain, this time to a children's charity. Kids Company had long benefited from a powerful prior that would take more than a decade to dislodge.[616] Successive British governments believed that a charity devoted to

vulnerable children possessed the commitment, accountability, and expertise to manage its own operations responsibly, leading them to provide more than £40 million in public funding over thirteen years.[617]

The ground these prior beliefs were resting on would begin to crack as a pattern emerged; warnings about cash flow, inadequate reserves, weak financial management, and uncertain long-term sustainability repeatedly surfaced from as early as 2002.[618] Despite those signals, each new request for assistance was interpreted less as evidence of recurring financial failure than as an urgent appeal to protect children who could not afford to lose support. Some officials eventually recognized the pattern.[619] In 2015, ministers approved a final £3 million grant despite concerns from other officials.[620] Kids Company collapsed only days after receiving it, and with it collapsed the prior belief that the worthiness of a cause was sufficient evidence that the institution

delivering it could govern itself responsibly.[621] What changed was the expectation governing how public grants should be awarded. It provides a valuable lesson that when repeated signals contradict a prior belief, stakeholders often replace autonomy with constraints through verification, compliance, formal controls, and greater oversight.

The journey to understand how expectations form arrives in distant Himalayan villages, where expectations emerged from survival and necessity. Exposure measures proximity, often elevating concerns when stakeholders stand close to the consequences of institutional conduct. This accounts for how much a person or group could gain, but also the consequences they could bear. Few stories embody this construct more vividly than the Chipko movement of the 1970s, which resisted commercial logging that threatened forests surrounding Himalayan villages.[622] The protest sought to preserve more than the environment. It sought to preserve the communities themselves, which depended on the forests for water, fuel, animal fodder, agriculture, and daily survival.[623] When loggers arrived near the village of Reni

in 1974, Gaura Devi and a group of local women placed themselves between the axes and the trees, wrapping their bodies around the trunks rather than allowing them to be cut.[624] They have been credited as the origin for the term "tree huggers".[625] What many people do not realize is that the word Chipko roughly translates as "to cling" or "to stick."[626] Environmental movements would later carry the compressed image of the tree hugger as a symbol of ecological activism, but the original movement was not simply about saving trees and reducing environmental degradation.[627] It was an attempt to minimize exposure, to protect a group of people's livelihood.

Exposure is a powerful influence on expectations because it makes consequences visible, personal, and difficult to ignore. Climate change and severe weather may feel remote until they arrive through a flooded home, smoke-filled polluted air, an unaffordable insurance premium, or a notice that insurance coverage will not be renewed. As the proximity stakeholders have to consequences increases it not only evolves their expectations, it often makes these expectations urgent, specific, and more likely to move from scrutiny to a concerted effort to constrain the institution. As a result, exposure often transforms a general concern into a demand for protection, participation, precaution, and accountability.

DOWNLOAD THE BOOK PROPOSAL

Up to this point, expectation formation has largely involved personal values, identity, prior experience, and exposure. But not all expectations are formed through a personal connection. Some are inherited from established rules, whether expressed through formal laws or social norms that already define what an institution is supposed to be and how it should act. Banks provide one of the clearest examples. Customers do not arrive at the baseline expectation of security and stability through personal introspection.[628] They expect a bank to be prudent, dependable, and capable of returning their money when asked because those standards have been attached to the institution for centuries.[629] Early public banks such as Banco di San Giorgio, founded in Genoa in 1407, helped establish the recognizable institutional role that modern banks would later inherit.[630] Financial institutions continue to reinforce that norm through a visual language of permanence and restraint, frequently using blue and other conservative design cues associated with trust, professionalism, and reliability.[631]

When a signal contradicts these established rules and norms, stakeholders often react with immediate alarm. For banks, a collapse in confidence may produce a bank run.[632] In 2008, rumors about the financial stability of the Bank of East Asia spread across Hong Kong, prompting depositors to form lines outside branches and withdraw their savings.[633] For many customers, the queue itself became the signal. They did not need to determine whether the bank was technically solvent. The sight of others removing their money suggested that the institution might no longer satisfy the most fundamental expectation attached to its role. Once that expectation fractured, waiting felt riskier than running. Rules work this way because they are more than written requirements. They are the settled standards society has attached to an institution, defining the conduct stakeholders assume should come naturally with the role.

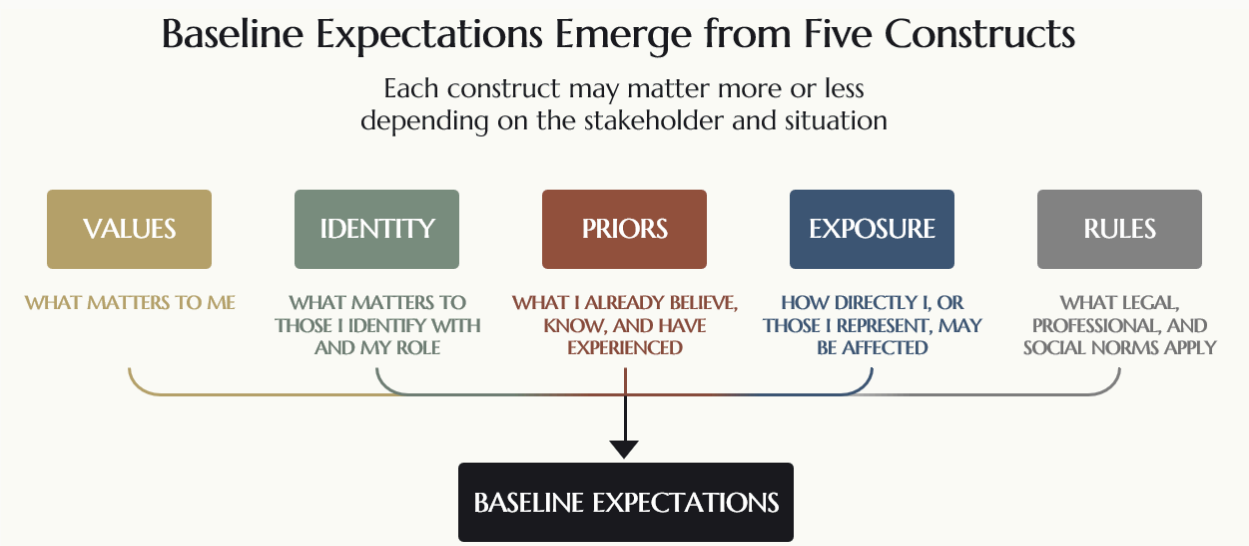
Many rules shape behavior, and expectations,
even when no one has written them down.

The value of the VIPER framework extends beyond explaining how institutional expectations form. It helps leaders understand why stakeholders may respond differently to the same conduct and why the standards applied to one institution may be inappropriate for another. The values, obligations, experiences, consequences, and norms surrounding a hospital are not the same as those surrounding a bank, a university, or a technology company. Even within the same institution, different stakeholders approach conduct from different starting positions. Put simply, the conditions that earn legitimacy for one company may be insufficient, irrelevant, or even objectionable if they were applied to another.

DOWNLOAD THE BOOK PROPOSAL



This explains why the baseline expectations are not uniform across different stakeholders. Consider a company preparing to close a manufacturing plant. Investors will expect leaders to protect enterprise value. Employees will expect job security, sufficient notice, a clear explanation, and fair severance. Customers will expect continuity of product quality. Regulators will expect compliance with labor, environmental, and disclosure requirements. Elected officials will expect consultation and consideration of local economic impact. None of these expectations are inherently irrational, and no single one necessarily governs the decision by itself. They differ because each stakeholder approaches the institution with a different combination of values, identity, priors, exposure, and rules. VIPER provides the explanation as to why the same institutional conduct can appear disciplined to one

stakeholder, unjust to another, overdue to a third, and dangerously disruptive to someone else.

Baseline expectations, therefore, do not represent one shared standard waiting to be discovered. They form a landscape of overlapping and sometimes competing judgments that institutions must understand before acting. The next question is what happens when new signals enter that landscape and begin to confirm, activate, intensify, or revise the baseline stakeholder expectations that were already there.

Passage 24: Connecting Conduct to Changing Expectations

Summary Text (Not Included in Final Copy): Stakeholder expectations evolve as new signals are interpreted, translated into revised beliefs, elevated into salient concerns, and directed toward institutions stakeholders believe are responsible. Reputation provides resilience during this process when previous conduct has earned trust, while weak or inconsistent conduct makes damaging interpretations more likely to take hold. The resulting expectations become more specific, shaping demands for standards, conduct, performance, accountability, and remedy. Reputation ultimately emerges from whether observed conduct aligns with the expectations stakeholders

DOWNLOAD THE BOOK PROPOSAL

believe legitimately apply, creating either reputational equity or an expectations gap. Because stakeholders occupy different positions and bring different expectations, exposure, and power, the same institutional conduct may strengthen collaboration with one group while weakening it with another.

Some expectations of an institution may remain quiet, even dormant, for years until something gives stakeholders a reason to reconsider them.[634] Others evolve gradually in the background, often without conscious attention. Unless asked directly, few stakeholders regularly consider what conduct they expect from an institution. That changes when a trigger arrives. It may take the form of a decision, an outcome, a direct experience, a public claim, a market development, or an event outside the institution's control. These observed signals introduce new evidence into the environment and begin to shift the landscape of expectations.[635] Because the same signal is interpreted from different stakeholder positions, it may elevate concern and create urgency for one stakeholder while having little effect on another.

Signals are rarely interpreted in isolation. A signal is treated as new evidence which must be compared to what they have previously observed, believed, or heard from others. A repeated pattern may reinforce an existing belief, while several credible signals that contradict a prior belief can gradually weaken the benefit of the doubt that once protected it.[636] The meaning of any one signal therefore depends partly on other evidence that has accumulated around it.

These observed signals can originate inside or outside the institution, and they do not need to arrive through formal communications. Before a signal can change a stakeholder's expectations, the stakeholder must work out what it means, whether it matters, and where responsibility lies.[637] As a result, stakeholder expectations evolve as an observed signal moves across three sequential stages which include interpretation, evaluation, and attribution. VIPER remains active throughout this expectation evolution process because values, identity, priors, exposure, and rules play a significant role in influencing which signals receive attention, which sources appear credible, how

conduct is interpreted, what consequences are anticipated, and whether the resulting conclusion becomes important enough to alter what the stakeholder expects.[638]

Interpretation is the process through which stakeholders make sense of a signal and determine what it means. A signal may be understood as conduct that builds credibility and rapport. It may also be viewed negatively, either as an isolated mistake or as evidence that an institution lacks integrity or competence. Interpretation is not neutral. Stakeholders assess new evidence through the standards, experiences, affiliations, risks, obligations, and prior beliefs they bring to the encounter. A signal may be difficult to understand, or it may not appear credible or relevant.[639] This helps explain why signals do not always revise beliefs or expectations.[640] But when sensemaking gives a stakeholder reason to reconsider a prior judgment, the signal often produces a revised belief about the institution.

DOWNLOAD THE BOOK PROPOSAL

A revised belief is the first key milestone a stakeholder must pass through before its judgment of an institution can change. Stakeholders may revise perceptions of the institution's competence, honesty, fairness, or credibility, among other attributes. However, a revised belief will affect expectations only when it resonates with the stakeholder's interests and concerns.[641] Consider a stakeholder that comes to view an institution as lacking innovation and adaptability. For regulators or news media outlets, this perception may not provide a material reason for concern. For investors, however, it may be critically important because it signals potential risk to the institution's future performance. Evaluation is the stage at which stakeholders assess a revised belief based on its relevance, importance, and potential impact. When a revised belief is considered consequential enough to require attention or action, it becomes a key concern that urges stakeholders to respond.

If a revised belief triggers a key concern, and an urgent need to act against it, the stakeholder will then seek to identify where responsibility for resolving the issue lies.[642] At this stage, stakeholders ask who caused the problem, who contributed to it, who

controlled the conditions, who could have prevented it, and who now has the authority or capacity to respond.[643] These questions lead to two forms of institutional responsibility. Causal responsibility which identifies who created, enabled, contributed to, or failed to prevent the outcome. And remedial responsibility which is focused on who has the mandate, resources, authority, or institutional purpose to explain, repair, or address it.

The two do not always fall on the same institution, nor do they always fall neatly on only one. A company, government, regulator, employer, platform, university, or nonprofit may be expected to act even when it did not directly cause the underlying problem.[644] In other cases, responsibility may be assigned broadly across an industry or even to a category such as "the business world."[645] Two lessons follow. First, an institution can suffer reputational scrutiny from conduct elsewhere in its industry when stakeholders assign distrust broadly rather than carefully distinguishing among

actors.[646] Second, responsibility may be assigned because an institution had the power, authority, or obligation to prevent or remedy an outcome, even when it did not cause it directly. In the Reputation Era, where societal consequences and negative externalities born from institutional scale are becoming more visible and easier to attribute, the distance between causing a problem and being expected to solve it is narrowing. This is problematic because once responsibility has been attributed to an institution, the stakeholder expectation begins to take a more concrete form. Stakeholders no longer ask only whether the institution should respond, they then begin defining what acceptable conduct should look like. Evolved expectations often arrive as revised standards, calls for increased accountability and oversight, and other demands for changes in institutional conduct.[647]

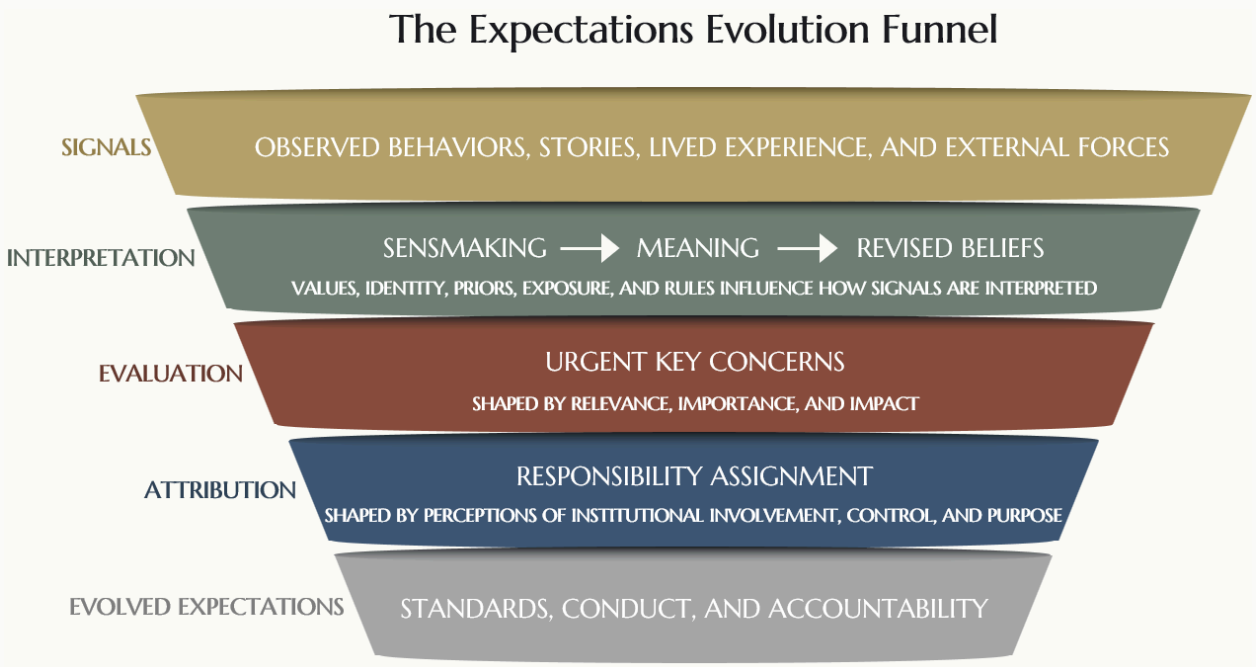
DOWNLOAD THE BOOK PROPOSAL



The central understanding of an institution's reputation now comes into view. Reputation is formed along the boundaries of a wide range of stakeholder expectations. Those expectations will differ across stakeholders, and no institution can satisfy every expectation at every moment. Its most durable response is to establish a consistent pattern of conduct grounded in its core values. When that conduct demonstrates integrity and contributes to broader societal prosperity, it increases the likelihood that the institution will meet the expectations of a wider range of stakeholders. Reputation therefore depends on stakeholder judgment of an institution's integrity and the broader societal prosperity it either creates or threatens. The challenge is that these expectations cannot be easily managed retroactively after conduct has already occurred. Stakeholder expectations must be understood early

DOWNLOAD THE BOOK PROPOSAL

enough to influence the values an institution integrates into the decisions, systems, incentives, and tradeoffs that eventually produce choice and conduct. Building reputation therefore requires leaders to understand both how values guide the institution internally and how its conduct can align with the expectations stakeholders use to judge it.

The two systems developed throughout this chapter now come together. Institutional values shape how an organization responds when a decision needs to be made. They influence the choices leaders make, the conduct those choices produce, the culture that develops through repeated behavior, and the signals that stakeholders eventually observe. VIPER shapes the expectations through which those signals are interpreted. The relationship between the two is continuous and reciprocal. Values influence the conduct stakeholders encounter, while stakeholder expectations help determine whether that conduct is seen as credible, responsible, and consistent with what the institution claims to stand for. An institution cannot select values capable of supporting reputation without understanding the expectations that its conduct is meant to fulfill. Nor can it understand stakeholder expectations without understanding the values, identities, priors, exposure, and rules from which they emerge.

DOWNLOAD THE BOOK PROPOSAL

Strong reputations are forged through repeated alignment between those systems. When values consistently guide decisions and become embedded in practices, institutions produce patterns of conduct that stakeholders can recognize and anticipate. Over time, that consistency can make the organization appear more reliable and predictable, increasing stakeholders' willingness to cooperate, remain, invest, advocate, tolerate uncertainty, or extend the benefit of the doubt.[648] These outcomes do not arise simply because the institution communicates effectively or presents an appealing identity. They develop when stakeholders repeatedly observe conduct that is consistent with what they believe the institution should do.

The opposite occurs when conduct is inconsistent, choices appear erratic, or institutional behavior fails to match the values the organization claims to uphold. An expectations gap opens between what stakeholders believe the institution should do and what it actually does. That gap becomes more consequential when the institution has publicly established the standard against which its conduct is judged. Christine Woodhouse, Director of Corporate Communications at Cox Communications,

[648] Mayer, R. C., Davis, J. H., & Schoorman, F. D. (1995). An Integrative Model of Organizational Trust. *The Academy of Management Review*, *20*(3), 709. https://doi.org/10.2307/258792

DOWNLOAD THE BOOK PROPOSAL

captures this exposure clearly. “Once an organization tells people what it values, it creates an expectation that those values will show up in its choices. Policies, benefits, leadership behavior and the way employees are treated all become evidence of whether the organization is actually living what it says.”[649] A stated value can therefore strengthen credibility when it is enacted, but it can also intensify reputational harm when the institution supplies evidence of contradiction.

This is why communication after a serious reputational failure has limited power. Communication can explain choices, acknowledge responsibility, reduce uncertainty, and provide evidence of a response. It cannot independently close a gap created by choices and conduct.[650] Once stakeholders believe an institution caused, enabled, ignored, or failed to remedy a meaningful problem, the institution must address the decisions, behaviors, systems, incentives, and responsibilities that produced that judgment. This means that words can provide context to aid in sensemaking, but conduct is the evidentiary proof that carries reputation.

The Core Functions Institutional Values Create

	WHAT IT CREATES	WHAT IT LOOKS LIKE
INFRASTRUCTURE	DECISION SYSTEMS	Incentives, authority, accountability, and consequences reflect stated priorities
	GOVERNANCE ARCHITECTURE	Risk management, escalation, and responses to fast-moving issues or crises
CODED BEHAVIOR	GUARDRAILS FOR CHOICES AND CONDUCT	Leaders can use values to guide decisions when rules are incomplete or priorities conflict
	GUIDING PRINCIPLES FOR APPROPRIATE BEHAVIORS	Clarity on what outcomes matter, work should be done, and what direction the institution is headed in
CONTINUITY	NON-NEGOTIABLE PRIORITIES	The institution protects core commitments while adapting its plans and actions
	RESPONSIVENESS AND PREDICTABILITY	Consistency enables stakeholders to move with the organization and change with external conditions

Values therefore perform three connected functions. They provide decision infrastructure when rules are incomplete and priorities compete, they create a shared code of conduct that makes behavior predictable both inside and outside the institution, and they supply the continuity that allows leaders to act quickly without sacrificing coherence.[651] [652] Integral's 2026 Integral Index Report offers one indication of the third function, finding that employees who believe an institution is living its integrity-driven values are more likely to respond positively to change

[651] Rempel, J. K., Holmes, J. G., & Zanna, M. P. (1985). Trust in close relationships. *Journal of Personality and Social Psychology*, *49*(1), 95–112. https://doi.org/10.1037/0022-3514.49.1.95

communications from leadership.[653] Values do not eliminate uncertainty, but they give people a stable basis for navigating it.[654]

The dynamic nature of values is a reminder that reputation is multidimensional and nonlinear. It emerges from a wide range of signals moving through a noisy environment that lacks uniform interpretation, and its meaning shifts from one stakeholder to the next, often producing expectations that diverge or polarize. Expectations surrounding one industry can look markedly different from those surrounding another, and they continue to vary among institutions within the same

[653] Integral Index. (n.d.). *Integral*. Retrieved September 21, 2026, from https://www.teamintegral.com/integral-index/

industry. Understanding how stakeholders form expectations, and how institutions produce conduct to meet them, is therefore only the first step in effective reputation management. The next step requires unpacking how the signal environment forces institutions into decision tests, and how the choices institutions make create new signals that move, interact, and gain force across the broader stakeholder ecosystem.

Chapter 8: Tension Along Multiple Dimensions

Passage 25: The Reputation Universe

Summary Text (Not Included in Final Copy): Reputation becomes difficult to manage once institutional conduct enters a complex stakeholder ecosystem. External forces create decision tests, stakeholders interpret resulting signals from different positions, and those differences shape expectations, urgency, and response. The challenge is maintaining coherent values that appropriately influence choice and conduct while navigating stakeholders who possess different information, experience different consequences, and may judge the same behavior in very different ways.

The signal environment is a wide and deep landscape. It is filled with highly volatile, fast-moving, and potentially consequential stories and other behavioral

DOWNLOAD THE BOOK PROPOSAL

observations.[655] Contrary to what most believe, the vast majority of these signals will not materially alter an institution's reputation.[656] Most will pass unnoticed while some others gather force, accumulate and intensify, or divide stakeholders around competing interpretations of what the institution should have done and should continue to do next.[657] The volatility can create the impression that reputation judgement is inherently fragile and erratic. But reputation is often far more durable, and harder to move or reshape, than most institutions realize.[658] The challenge therefore is not that reputation is fragile and in a constant state of vulnerability. The real challenge is that the choices and conduct an institution produces, whether by launching an initiative, making a commitment, or formulating a response, arrives in a signal environment that is already crowded, unstable, and difficult to predict.[659] This is because the signal environment contains external forces, the conduct of other institutions, competing narratives, and fragmented interpretations of the

consequences those choices may create.[660] In this environment, reputational signals face two challenges. First, they must break through the noise to gain visibility. Second, once the signal lands, it must survive the process of interpretation if its intended meaning can take shape.[661]

While it could be argued to be less chaotic than the signal environment, the stakeholder universe introduces another layer of complexity. From this point forward, a clear definition of what a stakeholder is must be understood. R. Edward Freeman, American philosopher and academic, offers a canonical definition of what a stakeholder is, "any group who is affected by or can affect the achievement of an institution's objectives."[662] The central challenge for institutional leaders is that stakeholder expectations often differ and sometimes directly conflict.[663] Employees, customers, investors, regulators, communities, political actors, journalists, and watchdogs do not occupy the same position in relation to the institution.[664] They do

not experience the same consequences, possess the same information, value the same outcomes, or control the same forms of collaboration.[665] Earning the stakeholder alignment, which reputation is dependent upon, often requires conduct and communication that navigates those differences.[666] This reveals another important distinction between brand and reputation. Brand strategies are often guided by the adage that a brand trying to appeal to everyone risks appealing strongly to no one.[667] Reputation, by contrast, requires support from a range of stakeholders whose expectations may differ sharply.[668] The challenge is not to become a different institution for each audience, but to maintain a coherent set of values that produces a consistent pattern of conduct that are broadly relevant across a range of stakeholder expectations.

For this reason, reputation leaders often feel as though they are operating without firm ground beneath them. Stakeholder expectations continue to evolve as the

external environment shifts, decision tests arrive, choices are made and institutional conduct is judged.[669] Leaders may know what they intend a decision to communicate, but intention offers little control once that decision enters the stakeholder ecosystem. The institution can only control the choice and the conduct that follows, but stakeholders are the arbiters of what that conduct comes to mean.[670] Once visible, the signal may reach stakeholders at different times, reinforce different prior beliefs, and provoke reactions that influence how other stakeholders interpret it.[671] A choice intended to demonstrate responsibility may instead be read as weakness, inconsistency, indifference, purpose-washing, or an overdue correction.[672] It may strengthen credibility with one stakeholder, weaken it with another, while passing by unnoticed by other stakeholders.[673] The meaning of institutional conduct is therefore not fixed when the decision is made. What was meant by choices and conduct develops among the stakeholders who encounter, interpret, and respond to it.

While institutional leaders are right to recognize that reputation often feels hard to manage and unstable, they often overlook where much of that instability begins. It often originates outside the institution, as external forces that repeatedly drive an institution into forced decisions.[674] External forces are composed of four main factors which constantly reshape the conditions under which legitimacy is ultimately determined. These external forces mainly stem from political, economic, systemic, and technological developments (PEST).[675] Together they alter expectations, constrain available options, intensify scrutiny, and introduce new signals into the stakeholder ecosystem.[676] Think of PEST as a practical lens for understanding how external forces unexpectedly alter the reputational terrain that institutions operate on.

External Forces Can Push Institutions Into Decisions That Test Their Reputation

EXAMPLES OF FORCES WITHIN EACH PEST CATEGORY
THE CATEGORIES MAY OVERLAP AND OTHER FORCES MAY ALSO APPLY

That altered terrain often forces institutions into decisions where institutions answer the question, "How will we make choices and conduct ourselves under changed conditions?" An emerging political issue, an economic shock, a cultural or social movement, or a technological advance often demands an answer. That choice becomes conduct, and that conduct produces a new signal for stakeholders to interpret. External forces do not change reputation directly, what they do is change the setting by presenting an institution with a choice to be made.[677] What they choose reveals what they value, what they are prepared to protect, what they will

change, and what they believe they can sacrifice.[678] That choice sends a signal, which can be judged, at this point reputation may change for better or worse.

Political forces can abruptly place institutions in conflict with governing authority.[679] Take for example, Bears Ears National Monument which encompasses a vast landscape in southeastern Utah containing archaeological sites, burial grounds, and places sacred to several Tribal Nations.[680] After President Obama protected approximately 1.35 million acres in 2016, President Trump reduced the monument by roughly 85 percent the following year, removing federal protections from more than one million acres.[681] Patagonia had already made public-land conservation central to its institutional identity and supported the monument's creation.[682] Patagonia viewed it as a cultural

and environmental sanctity violation.[683] The decision test arrived. The company could soften its environmental position to avoid confrontation with the president or dig in and defend what it held sacred. The response, predictably in line with Patagonia's values, was to replace its homepage with the declaration "The President Stole Your Land" and the company joined Tribal and conservation organizations litigation. In this case Patagonia's values guided its decision making, it already knew what it was prepared to defend despite the potential political costs.

Economic forces can create legitimate cost pressures while also giving institutions cover to extract more from stakeholders than those pressures require.[684] Cal-Maine Foods faced that test when avian flu reduced the national supply of eggs and sent prices sharply higher.[685] The supply shock was real, but Cal-Maine reported few positive cases at its own facilities through July 2023.[686] In one quarter, its average

selling price for conventional eggs rose from $1.46 to $3.68 per dozen even as production costs increased by only about 18 percent.[687] The disparity prompted advocates to accuse major producers of inflating prices, although Cal-Maine maintained that it followed market-based pricing in response to reduced supply.[688] Economic factors such as inflation and supply scarcity created a challenging decision. The choice was to either follow higher market prices or exercise restraint on pricing for a basic food staple. Cal-Maine's prices, which the company said followed established market-based formulas, rose with the constrained market, leaving stakeholders to decide whether it had demonstrated financial resilience or taken advantage of their economic vulnerability.[689]

Systemic forces can emerge from broader societal concerns, such as environmental degradation to issues that harm specific communities and cultures.[690] These systemic

forces often cause social movements, representing a broader shift in people's values, altering how they expect institutions to operate.[691] Tractor Supply became caught between two such movements. In September 2021, amid the broader expansion of corporate commitments following the Black Lives Matter movement,[692] the company announced five-year diversity and environmental goals. These included increasing people of color in management by 50 percent, expanding spending with diverse suppliers by 35 percent, and pursuing ambitious emissions targets.[693] In June 2024, conservative activist Robby Starbuck began publicly targeting those policies, arguing that they conflicted with the values and expectations of Tractor Supply's rural customer base.[694] What followed was pressure to make a decision. Defend the commitments, revise them, or abandon them. Three weeks later, the company eliminated its DEI roles, ended several external sponsorships, stopped participating in the Human Rights Campaign's corporate-equality survey, and withdrew its

carbon-emissions targets.[695] Tractor Supply was among several high-profile companies that scaled back diversity and climate commitments during this period.[696] Critics read the reversal as capitulation to activist pressure, while supporters argued that it realigned the company with the expectations of its core customers. Both readings illustrate how a single decision test can produce opposing judgments of the same conduct.

Technological forces create conditions for challenging decisions when new innovations and advances become available before institutions or society have determined how they should be governed.[697] Axon faced such a test when facial-recognition technology advanced enough to be integrated with the police body cameras it supplied.[698] The combination promised a valuable new capability, allowing officers to identify people encountered in public. It also risked transforming cameras intended to document police conduct into systems of continuous

surveillance.[699] A decision test arrived when studies showed that facial recognition performed less reliably across some racial, ethnic, and gender groups.[700] Axon chose to consult an independent ethics board to examine the technology, and in 2019 the board concluded that it was not accurate or equitable enough to justify use on body-worn cameras.[701] The company accepted the recommendation and declined to commercialize the capability. Axon's decision demonstrated that technological readiness involves more than proving that a product can function. It also requires determining whether the institution can deploy it fairly, govern its consequences, and justify the harm that may follow when it fails.

The decision pressure created by these external forces rarely present one obvious correct response. They require institutions to weigh short-term performance against long-term consequence, efficiency against fairness, speed against precaution, or public commitments against political and commercial pressure.[702] This is where values

become an operational governance tool. They do not eliminate the consequence or tradeoff, but they help shape behavioral coherence around what the institution will maintain, revise, resist, or sacrifice when competing expectations cannot all be satisfied. Without that grounding, decisions become improvised, driven by short-term priorities, and potentially inconsistent with prior behavior.[703] Decision tests also remove the concept of a neutral sideline as silence, avoidance, delay, resistance, and inaction are all choices and the lack of response is conduct itself.[704] What can be guaranteed is that any choice, or the absence of one, produces a signal, even when few stakeholders notice it which shows what the institution prioritizes when its values are tested.

What the institution cannot expect is that its choice will be interpreted from one common vantage point. This is because stakeholders hold different relationships with the institution, giving each a unique perspective and visibility to judge the institution against.[705] Employees may observe leadership behavior, incentives, informal norms, and whether stated values become enacted into daily practice. Customers encounter

the institution through products, pricing, service, and reliability. Suppliers see bargaining, payment, procurement, and the transfer of risk. Communities experience local employment, environmental effects, and investment or withdrawal. Investors often encounter a more mediated institution through disclosure, governance information, analysts, and executive communication, while regulators, journalists, and NGOs assemble evidence through filings, complaints, documents, insiders, and public records. As a result, no single stakeholder holds a complete view of the institution. Each encounters a partial reality shaped by role, access, exposure, and proximity.

But lack of proximity does not mean stakeholders abandon the desire to assess an institution's integrity. When they cannot observe conduct directly, they often look to how other stakeholders experience the institution as a heuristic for their own judgment.[706] This is why employee experience is often viewed as a key institutional integrity test. According to Heather McCague, TITLE STILL TO BE DEFINED, "Reputation gets built inside the building long before anyone outside can see it. Employees are the first stakeholders to test whether your values are real, and they test them constantly, in moments no external audience will ever witness."[707] As a result, the

perception of employee experience offers a clear window into how other stakeholders can derive their own reputational judgement. Dignity is among the most basic standards stakeholders apply to institutional conduct, including whether people are treated fairly, protected from harm, and heard when they raise concerns.[708] Because external stakeholders cannot live the internal workplace experience they leverage signals such as strong employee advocacy and morale to reinforce and shape their own judgement.[709] This is also why employee turnover, walkouts, resignations, leaks, safety violations, and treatment of whistleblowing can also intensify the salience of external stakeholder concerns, providing a catalyst for increased scrutiny.[710] The employee experience often acts as a bellwether for broader stakeholder judgement, as it helps outsiders infer whether the institution acts with integrity. Those reactions are not automatically accurate or fully representative across all reputation stakeholders, but they can become powerful secondary signals when they establish a pattern and become more widespread.

The bellwether nature of the employee experience often leads institutions to assume that one stakeholder, or a finite set of stakeholders, matters most to their reputation.[711] Some lean into customer-centricity because reputation is often measured through the customer interface, where established research, tools, and commercial incentives make customer perceptions easier to understand and act

upon.[712] For others, it may be employees, investors, regulators, or lawmakers because that group appears to hold the greatest influence over an immediate reputation problem or the institution's license to operate.[713] The instinct is understandable because leaders are forced to decide where to focus attention, budgets, and accountability. The difficulty is that prioritization can quietly harden into fixation, turning a practical management choice into a distorted view of the reputation stakeholder ecosystem.[714]

Another factor that drives reputation managers to fixate on stakeholder groups is how institutions place stakeholders into categories. While categories differ from organization to organization, most allocate stakeholders into three groups that are broadly categorized as internal facing, external facing, or institutional.[715] The main purpose is to help organize the work, but they often mirror the structure of the

institution more closely than the way unique stakeholders in these groups form expectations and operate.[716] This is especially evident when journalists, investors, regulators, policymakers, NGOs, and other institutional actors are managed or understood as one highly influential "key opinion" audience.[717] Although these stakeholders may all shape institutional reputation, they possess different information, apply different standards, move at different speeds, and control different outcomes.[718] Comparing journalists with regulators would reveal distinct expectations, reaction times, and unique effects on an institution's license to operate.[719] Grouping them may simplify the study of influential perspectives, but it can obscure the very differences that determine how each affects an organization's reputation.

A third fixation emerges when institutional leaders create a subgroup of the general population they believe is more likely to notice, interpret, and engage with

reputational signals.[720] The Opinion Elite represents the most ambitious attempt to identify that group. It is typically defined as an influential subsegment of the general population, typically possessing a college education, higher income, and daily news consumption.[721] Those criteria create a predictable skew.[722] A 2025 Gallup survey found that 87 percent of adults in households earning at least $100,000 owned stock, compared with only 28 percent of those earning less than $50,000.[723] This gives the Opinion Elite much greater personal exposure to corporate financial performance, market volatility, and financial resilience.[724] At the same time, the criteria used to construct this segment does not select for exposure to community disruption, environmental consequences, or other negative externalities created by institutional scale.[725] The issue is not that this portion of the general public is invalid. It

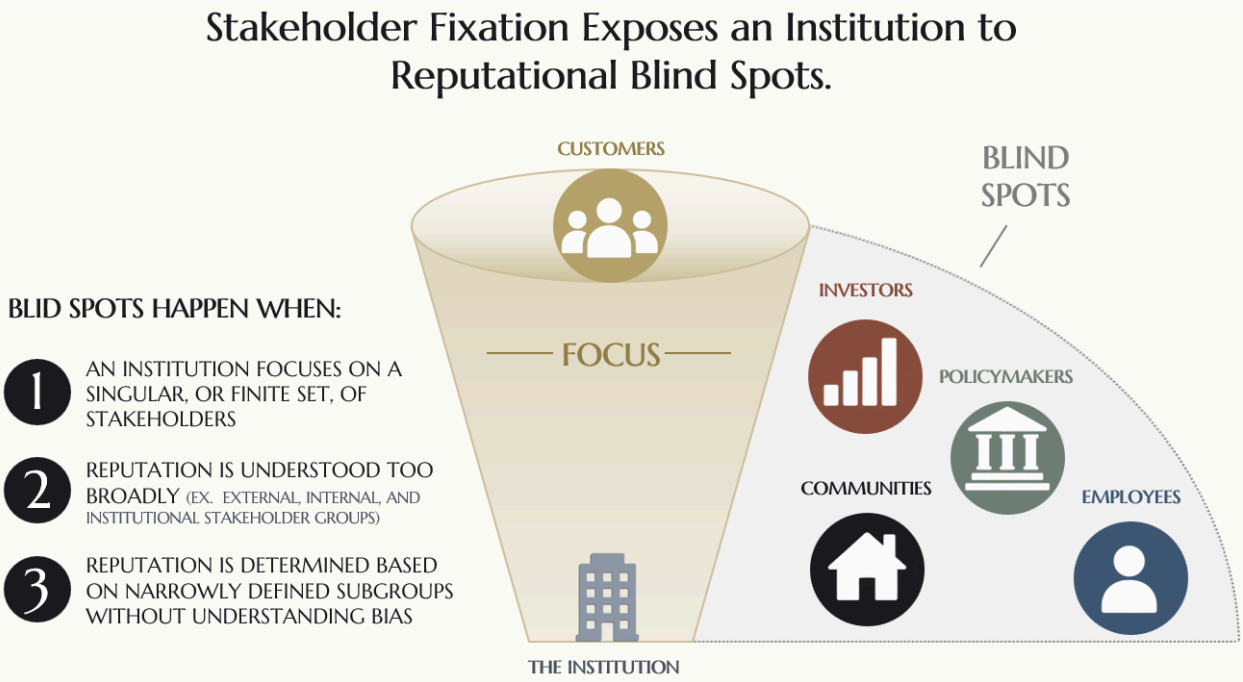
is that its identity and exposure may make it more attuned to prosperity and desirability signals than to integrity failures experienced elsewhere.[726] As a result, narrowing the population into subgroups based on demographics can inadvertently make reputational risks less detectable.



This distinction matters because stakeholders who experience institutional consequences directly may apply different expectations and respond with greater urgency. Consider Sharon Lavigne, the St. James Parish community leader and founder of RISE St. James introduced earlier in the book. She became nationally visible after

[726] Grunig, J. E. (1997). A Situational Theory of Publics: Conceptual History, Recent Challenges, and New Research. In D. Moss, T. MacManus, & D. Vercic (Eds.), *Public Relations Research: An International Perspective* (pp. 3–48). International Thomson Business Press.

organizing opposition to proposed petrochemical development in the Louisiana region commonly known as Cancer Alley.[727] Median household income in St. James Parish is approximately $37,140, and lower still in the communities close to the proposed industrial sites,[728] meaning many residents would not meet the income threshold typically used to classify an Opinion Elite audience. Yet those residents face far greater proximity to the potential pollution, health consequences, and diminished quality of life associated with industrial development.[729] As covered in the previous chapter, their exposure gives them stronger reasons to question institutional integrity, organize others, and demand action. That proximity helped give rise to RISE St. James, a grassroots group that has mounted sustained legal and public challenges to proposed petrochemical development in the parish.[730] Understanding an institution's reputation through the lens of an Opinion Elite may therefore be less reliable as a proxy for who will recognize a legitimacy failure first, feel compelled to respond, or

create consequences that an institution must navigate through. This case study reveals that attention to news signals alone does not determine reputational significance, nor does it isolate the most influential stakeholders that can impact reputation.

Passage 26: Different Stakeholders, Different Clocks

Summary Text (Not Included in Final Copy): Signals do not become meaningful or consequential at the same speed for every stakeholder. Differences in exposure, evidence, authority, incentives, and perceived harm create distinct stakeholder clocks, allowing some signals to remain latent while others trigger immediate response. Those clocks can compress when urgency, exposure, or corroborating stakeholder action

increases the perceived legitimacy of a concern, creating fast-moving multi-stakeholder consequences.

A stakeholder's exposure significantly influences how quickly a signal becomes a meaningful reason to act. For Sharon Lavigne, and other residents of St. James Parish, petrochemical development in the community was not an abstract news story that felt distant or unrelatable. They understood the potential consequences to their health, land, family, and quality of life. The signal therefore moved quickly through the stages from observation to attribution to response, all of which triggered in rapid succession. Conversely, a more distant stakeholder may encounter the same information through a headline, briefly register it, and then set it aside. This is called signal latency. The signal has not necessarily been missed or judged unimportant. It may simply require additional evidence, greater personal relevance, or stronger resonance before it becomes sufficiently credible, urgent, or actionable to alter beliefs or provoke a response.[731] A signal can therefore remain dormant long before it becomes consequential.[732] This creates a challenge for institutions because awareness alone, whether of a news story, institutional conduct, stakeholder behavior, or

external forces (PEST), offers little guarantee of whether, when, or how stakeholders will respond.

Latency should not be mistaken for indifference. Stakeholders may recognize the significance of a signal without being willing, able, or sufficiently motivated to respond to it.[733] Latency is therefore a waiting game, but the conditions of that wait differ by stakeholder.[734] Reputation itself can also produce latency. Consider an institution with a strong prior reputation. That reputation gives stakeholders a reason to extend the benefit of the doubt, allowing troubling signals to accumulate without an immediate visible stakeholder response.[735] This is an important concept because it often leads institutions to draw down on their existing legitimacy while appearing to escape consequence. A lack of stakeholder response is often interpreted as acceptance, as opposed to recognizing it as signal latency. Other factors can also drive latency. Employees fear retaliation.[736] Customers find no suitable marketplace alternative.

Journalists face verification doubts, access loss, or commercial pressure.[737] But changes in the environment such as an improved economy, new internal leadership, new marketplace entrants, technology advances, and other factors can unlock stakeholder latency, quickly opening an institution to scrutiny and potential delegitimization.[738] The key lesson here is that each stakeholder operates under different constraints, standards, incentives, and clocks.

A common mistake is to assume that once a signal enters the stakeholder ecosystem, they interpret it, judge it, and act on it at roughly the same time. They do not.[739] Some stakeholders are positioned and incentivized to move quickly. Social-media users, breaking-news media, activists, directly affected communities, and short-horizon investors often derive value from early attention, rapid framing, and immediate action.[740] Speed can generate commercial advantage, shape the first public interpretation, mobilize others, or increase pressure on the institution before competing explanations take hold.[741] Their clocks are not fast simply because they are impulsive. They are fast because their roles often reward visibility, urgency, and first response.

Fast-moving stakeholders can assign meaning to a signal and produce consequences before an institution has time to regain control of its interpretation.[742] Peloton

more than 9 percent, temporarily erasing approximately $942 million in market value.[749] Peloton expressed disappointment that some viewers had misinterpreted its intended message,[750] but that response reinforced the larger lesson. Institutions can control the reactive messaging that explains what a signal was intended to mean, but they cannot control how quickly stakeholders assign it a different meaning, mobilize around it, or produce consequences.

Other stakeholders operate more deliberately because the legitimacy of their response depends on the process. Boards, regulators, courts, standards bodies, and academics often require evidence, investigation, authorization, materiality, review, or consensus before acting in ways that carry formal consequence.[751] Their slow clock does not necessarily indicate delayed awareness or weak concern. A regulator may understand the seriousness of an issue immediately but still need months to investigate, define jurisdiction, consult affected parties, and determine how intervention would alter the broader environment.[752] A court may recognize the harm but remain constrained by evidence, procedure, standing, and precedent.[753] For these stakeholders, acting too quickly can weaken the credibility, durability, or fairness of the eventual response.

The regulation of synthetic food dyes provides an example of how regulators often move on slower clocks than other stakeholders. In 2007, a British study raised concerns that several synthetic colors, combined with a preservative, could affect activity and attention in some children.[754] European regulators reviewed the evidence and adopted a precautionary legal response.[755] By 2010, foods containing six specified dyes were required to carry a warning that they may adversely affect children's activity and attention.[756] The process still took three years. American regulators considered similar concerns but operated on a different clock. In 2011, an FDA advisory committee concluded that a causal link between approved color additives and behavioral effects had not been established, recommending further research rather than comparable warning labels.[757] The dyes remained permitted for more than another decade.[758] In January 2025 the FDA revoked authorization for Red No. 3 on

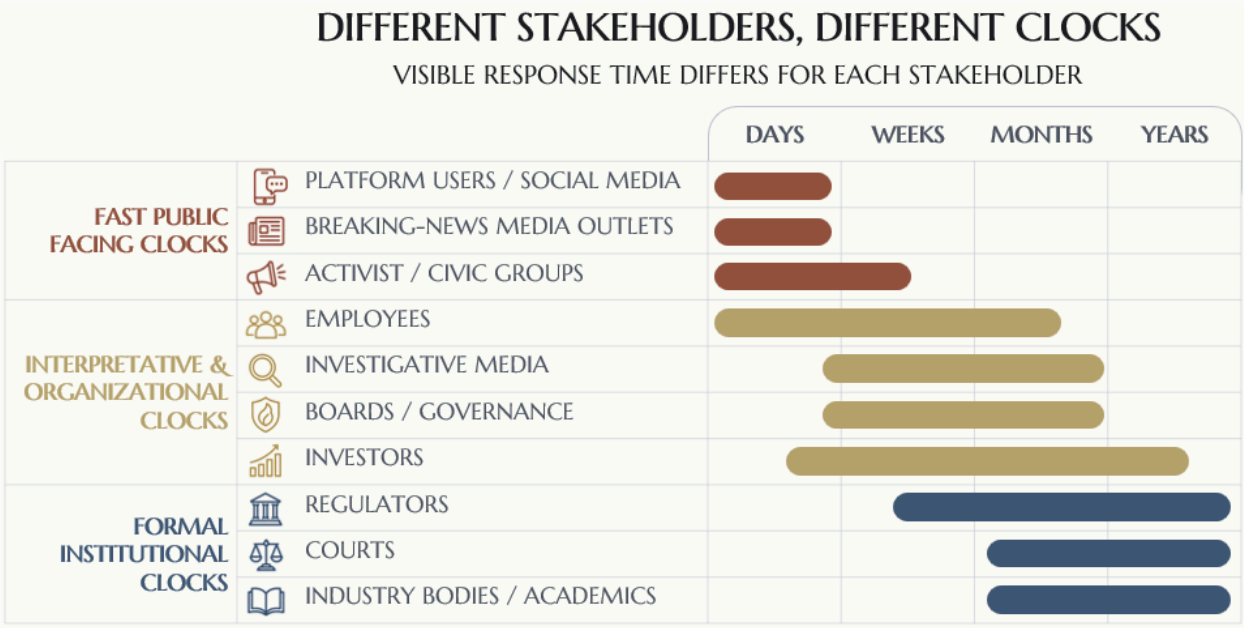
separate grounds, and in April 2025, eighteen years after the British study, Health and Human Services Secretary Robert F. Kennedy Jr. and the FDA announced an effort to phase petroleum-based synthetic dyes out of the American food supply.[759] The underlying signal was visible in both jurisdictions, but it produced formal consequences on radically different timelines. Regulatory clocks therefore vary not only with the complexity of an issue, but with the evidence regulators require and the degree of precaution their systems are prepared to exercise.



Reputational judgment therefore does not move along one shared, neatly organized timeline. Each stakeholder's response time is shaped by jurisdiction, culture, proximity

[759] Affairs (ASPA), A. S. for P. (2025, April 22). *HHS, FDA to Phase Out Petroleum-Based Synthetic Dyes in Nation's Food Supply* [Press Release]. https://www.hhs.gov/press-room/hhs-fda-food-dyes-food.html

to harm, access to evidence, institutional authority, professional mandate, personal incentives, and the risks attached to speaking or acting. Those conditions make response times uneven, but not random. Stakeholders react in recognizable patterns, which allows institutions to anticipate who is likely to move first, who will require greater evidence or procedural authority, and who may remain silent even after concern has formed. Responses often overlap, yet stakeholders less commonly receive the same signal and move together. The exception arises when urgency, exposure, or perceived risk becomes powerful enough to call an institution's legitimacy sharply into question, compressing stakeholder clocks and potentially producing a fast-moving crisis.[760]

Stakeholder clocks tend to compress as an institution's legitimacy comes under sharper question. Riot Games provides an example of how institutional conduct triggered a fast-moving multi-stakeholder response. An August 2018 exposé covered by investigative journalists, Kotaku, described women being talked over, underpaid, and denied advancement, while male employees and senior figures allegedly sent unsolicited images and behaved in manners that were sexually harassing and

degrading.[761] The violation was not simply crude behavior. It was the appearance of an institution that expected women to absorb humiliation and professional disadvantage while protecting the culture and leaders responsible for it. Three months after the report, former employees filed a class-action lawsuit, and in May 2019 more than 150 employees walked out to protest the culture and Riot's use of forced arbitration.[762] California regulators then entered the dispute, and in December 2021 Riot agreed to a $100 million settlement and systemic workplace reforms.[763] A court later granted final approval of a settlement covering more than 2,300 women employees and contractors.[764] The clocks did not start together, but accumulating evidence, employee validation, public scrutiny, and regulatory authority moved the dispute to formal consequences within a few years, faster than workplace disputes of this kind often resolve.

The Riot Games example reveals that stakeholder clocks can compress, shifting stakeholders out of their normal response times. It also reveals that stakeholder response does not occur in isolation.[765] One stakeholder's action can create a new signal that elevates the urgency of an issue, reinforces the concerns of others, or activates stakeholders who had previously remained on the sidelines.[766] Some stakeholders may also exert outsized influence by making an issue more visible, credible, or consequential to others within the ecosystem.[767] The stakeholder ecosystem is therefore a dynamic social system in which signals are transferred, reinforced, and cross-validated across relationships.[768] Reputational judgment does not form through a set of independent assessments.[769] It develops through and within stakeholder connections, so that one stakeholder's response shapes another's beliefs,

expectations, and willingness to act.[770] When those connections amplify pressure quickly, institutions are left with less time to understand an issue, and reactive reputation management becomes more complex and more costly.

Passage 27: The Path to Admiration and Accusation

Summary Text (Not Included in Final Copy): Stakeholder responses do not simply accelerate issues; they can multiply in reinforcing directions or divide around competing expectations. Those dynamics shape whether signals build credibility, urgency, collaboration, resistance, or constraint, and they help explain why the same institutional conduct can generate admiration among some stakeholders and accusation among others. The central challenge is creating enough alignment between values, stakeholder expectations, and conduct that the institution remains predictable and worthy of collaboration even when disagreement persists.

For good reason reputation managers often look for signs of signal momentum as a means of proactively engaging with potential issues before reputation risk fully

[770] Rowley, T. J., & Moldoveanu, M. (2003). When Will Stakeholder Groups Act? An Interest- and Identity-Based Model of Stakeholder Group Mobilization. *The Academy of Management Review*, *28*(2), 204. https://doi.org/10.2307/30040709

DOWNLOAD THE BOOK PROPOSAL

emerges. But momentum is only half the story, the other half is signal amplification. When multiple stakeholders move simultaneously, their responses begin to amplify or divide in ways that can either reinforce institutional legitimacy or fracture it further.[771] The reason why stakeholders do not form judgments in complete independence from one another is because none of them hold a complete view of the institution, its conduct, or the consequences it creates.[772] Each encounters only part of the evidence and relies on the broader signal environment to fill in what cannot be observed directly.[773] Stakeholders are therefore constantly scanning the signal environment to determine if the institution is behaving predictably, reliably, and in ways that justify continued collaboration.[774] One signal may remain isolated, easy to dismiss, or explained as an exception.[775] But a pattern of related signals become more

DOWNLOAD THE BOOK PROPOSAL

consequential as they accumulate through repetition, added evidence, and broader context.[776]

An accumulation of signals becomes more meaningful when distinct experiences, sources, and stakeholders point toward a similar conclusion. As signals accumulate, a concern can become more visible and salient. Its consequences may seem more immediate, urgency may rise, and stakeholders may begin to form expectations, assign responsibility, and respond.[777] This process is called issue acceleration. It is the accumulation and connection of related signals within the signal environment, through which stakeholder concerns take shape, forming a reputational issue.[778] It does not prove that the underlying beliefs connected with the issue are correct, or that stakeholders have reached consensus, nor does it guarantee reputational harm. But as issues accelerate, institutions may face mounting pressure to make a choice, bringing them to a challenging decision and how they choose to respond to the issue becomes a new signal for other stakeholders to interpret. Institutional conduct and

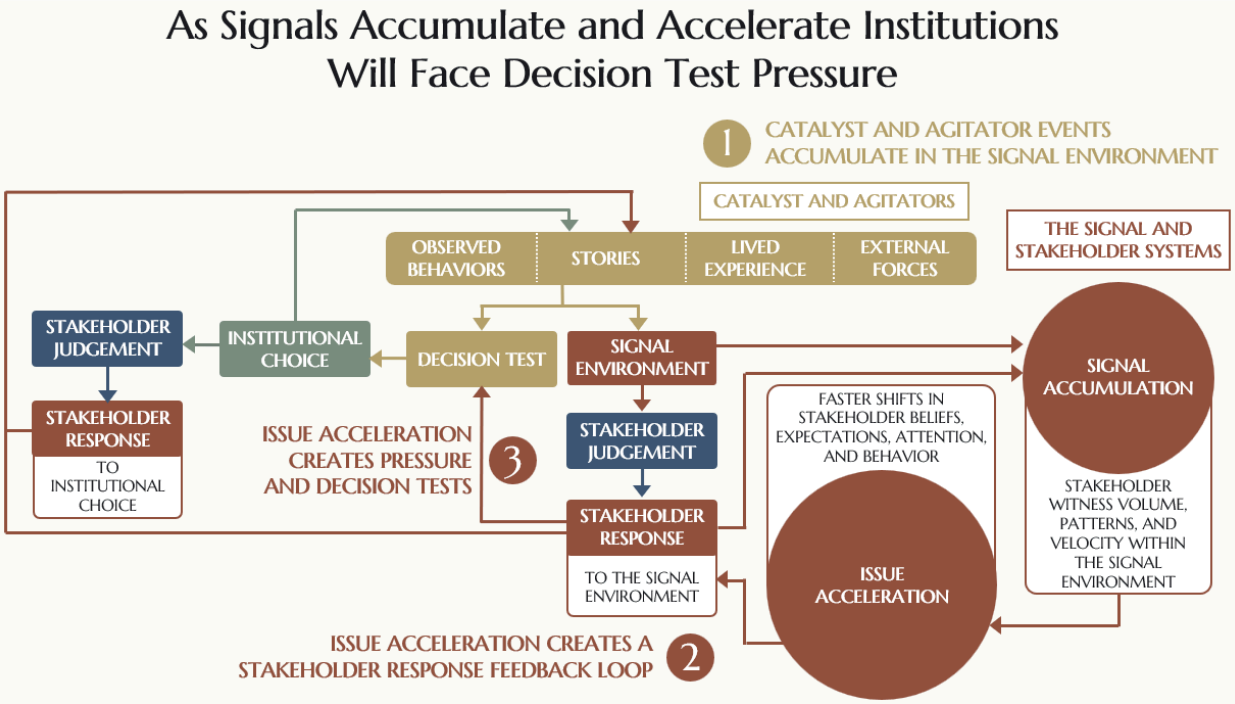
stakeholder responses therefore form a continuing signal loop through which issues can magnify and accelerate.



Issue acceleration often intensifies the pressure for institutions to act, but it is not the pressure alone that creates reputational impact. The quantification of the signal environment, such as the volume of attention or general sentiment, does not guarantee that the judgement of stakeholders will be altered or that reputation impact will follow.[779] What makes reputational harm more likely is the gap that develops between what stakeholders expect and what they believe the institution's

choices and conduct mean.[780] This is the expectation gap. Acceleration can make that gap more difficult to assess because institutions may be forced to act before stakeholder expectations have fully formed or become widely understood.[781] But what creates reputation risk is not the issue acceleration itself, it is the risk that an institutional response is viewed inconsistent with the stakeholder expectations.[782]

Because issue acceleration is a defining feature of the Reputation Era, it raises the practical value of the decision infrastructure described in the previous chapter.[783] Acting consistently with values does not guarantee that an institution will avoid reputational harm, but it gives leaders a defensible basis for deciding quickly while stakeholder expectations are still forming, and it reduces the risk of an improvised response that opens a costly say-do gap.[784] Stakeholder intelligence complements that

foundation by showing how expectations are changing, where pressure is building, and what conduct stakeholders may consider appropriate.[785] When events move faster than those expectations can be fully understood, values supply the continuity needed to act, assess the consequences, and shape what comes next.

Understanding the velocity that signals travel through the signal environment can be critically important to detecting reputation risk before it accumulates.[786] But what is just as important, if not more, is to understand how stakeholders react when they witness each other respond to the same issue. Now it is no longer just an abstract story to observe and interpret. The issue has transformed, gathering inertia and momentum to potentially move multiple stakeholders into an aligned response. In this case the stakeholder response is a signal, one that further amplifies the issues visibility, credibility, urgency, and proximity to harm, which acts like a catalyst influencing other stakeholders to respond as well.[787] This pattern is called the multiplier effect, a condition where stakeholders join along shared expectations and magnify pressure on

an institution. It occurs when two conditions are met. First, at least one stakeholder must respond to an issue in a way that other stakeholders can observe. Second, other stakeholders must interpret that response and respond in their own way to add or intensify pressure on the institution. This multiplier effect is a dynamic concept that is consistent with social movement theory, which examines how shared concerns and collective action enable groups to exert and magnify their influence.[788]

The multiplier effect can make stakeholder expectations more consequential when joined responses increase the credibility and visibility of signals that had previously remained latent.[789] The October 2017, investigations into Harvey Weinstein, offers a powerful example of how consequential a multiplier effect can be.[790] Harvey Weinstein, one of Hollywood's most powerful film producers, became the subject of allegations of sexual harassment and assault spanning decades.[791] The initial report created a signal, but the response from other stakeholders transformed its meaning and reach. Actress Alyssa Milano encouraged people who had experienced harassment or assault to respond with "Me Too," a phrase originally created years earlier by activist Tarana Burke.[792] Within 24 hours, the hashtag #metoo was trending, Facebook recorded more than 12 million posts, comments, and reactions, while the hashtag appeared nearly one million times on Twitter within 48 hours.[793] Experiences

that had often remained private or isolated suddenly became visible alongside thousands of similar accounts.[794] Each response did not prove another person's experience, but collectively they made sexual harassment harder to dismiss as a series of unrelated allegations.[795] The resulting multiplier increased visibility while changing what stakeholders considered credible and plausible.[796] Additional allegations followed against prominent figures including Kevin Spacey and Matt Lauer, producing additional reputational consequences across entertainment and media.[797] Weinstein was fired from his company and expelled from the Academy of Motion Picture Arts and Sciences. His 2020 New York conviction was later overturned, and following a 2025 retrial he was sentenced in September 2026 to 15 years in prison. He was separately convicted in California, and he has continued to maintain his innocence.[798]

What had long existed as latent signals became a visible pattern capable of forcing institutions to respond.

Multiplier effects become more likely when stakeholders recognize both the urgency of a threat and the number of people it may affect. The Pacific Gas and Electric Company (PG&E) chromium contamination, illustrates how stakeholder responses can amplify an issue. At a natural-gas compressor station in Hinkley, California, cooling towers used chromium-6 to prevent corrosion, and their wastewater was discharged into nearby ponds.[799] The chemical is associated with serious health risks, including cancer, and regulators later determined that contamination extended across an area at least eight miles long and two miles wide.[800] The issue sparked a multiplier effect in 1991 when Erin Brockovich, then a legal clerk working for attorney Ed Masry, began investigating medical records connected to Hinkley residents.[801] She went door to door, spoke with families reporting cancers and other illnesses, collected records, and helped connect experiences that had previously existed as isolated signals.[802] More

than 600 residents ultimately joined litigation against PG&E.[803] Within roughly five years, the case produced a $333 million settlement, showing how greater urgency and perceived exposure can also compress stakeholder clocks once evidence, community action, and legal pressure begin reinforcing one another.[804] The alarming nature of this issue created further multiplier effects long after the settlement. In 2000, Erin Brockovich, starring Julia Roberts, carried the Hinkley story to millions of people worldwide, extending visibility and calls to take action against similar pollution related environmental-health claims long after the original case had ended.[805]

Multiplier effects are not always negative. As covered earlier in the book, negative signals have a greater propensity to travel and resonate, but stakeholder responses can also amplify positive signals and reinforce institutional conduct that is viewed as credible and worthy of collaboration. Positive multipliers are more likely when institutions make their vision visible through clear values, commitments, and goals that give stakeholders something concrete to align around.[806] It helps create a pattern of

reputation-building behavior rather than a series of disconnected responses to individual decision tests, which can be slower, less consistent, and more costly to the institution. Paul Polman's tenure at Unilever provides a strong example of a positive multiplier effect. After becoming CEO in 2009, Polman argued that the company should create long-term value by serving a broader stakeholder ecosystem.[807] His position emphasized long-term investments in sustainable growth and resilience rather than optimizing primarily for the short-term financial results investors and analysts commonly expect each quarter.[808] In 2010, Unilever launched its Sustainable Living Plan, establishing more than 50 time-bound commitments aimed at reducing environmental impact while increasing positive social impact. Those commitments were reinforced through company values, operating decisions, supplier relationships, NGO partnerships, and employees rather than confined to a single communications campaign or a series of disconnected impact initiatives.[809] By 2018, 90 percent of surveyed employees said they were proud to work for Unilever, while 92 percent of employees who believed they could live their purpose at the company also said their jobs inspired them to go the extra mile.[810] Unilever reported that its Sustainable Living

Brands were growing 69 percent faster than the rest of the business and generated 75 percent of company growth that year.[811] Across Polman's tenure, shareholders received an approximate 290 percent return.[812] What Polman was building was more than a sustainability program. It was a reputation infrastructure in which visible commitments and strong corporate values gave stakeholders reasons to collaborate, and their participation generated additional signals that encouraged other stakeholders to align and participate as well. While most attribute success to Polman it should be noted that his approach was not universally admired. After Polman's departure, as his successor pushed purpose down to the level of individual brands, some prominent investors argued publicly that the emphasis had come at the expense of performance,[813] a tension the Danone case later in this chapter makes more visible.

Multiplier effects can amplify both positive and negative signals, but stakeholder responses do not always reinforce one another in the same direction. They also hold the potential to divide. A divider effect occurs when beliefs about how an institution

should behave diverge. This happens when key stakeholders develop conflicting expectations, with competing narratives about what the institution should do.[814] These differences arise because stakeholders form expectations in different ways, influenced by contrasting values, identities, prior experiences and beliefs, exposure, and accepted rules for interpreting conduct. The VIPER framework, covered in the previous chapter, provides a foundation for understanding why stakeholders can arrive at different expectations of institutions.

The result is more than simple disagreement across stakeholders. Each stakeholder response becomes a new signal and additional evidence for others to interpret and divide against. As different stakeholders reinforce their own unique expectations, the institution then faces unique expectation gaps that widen in different directions at the same time. Institutions are then pushed toward another decision test, often forced to choose between competing stakeholder expectations or make an attempt to compromise that may not satisfy either completely.[815] Divider effects can therefore be particularly painful and enduring because they strain collaboration and can sustain

scrutiny for months or years.[816] When these responses repeatedly come from stakeholders with sufficient power, proximity, or ability to constrain the institution, division can also harden into constraint rings, covered in chapter three, that narrow the choices available to institutional leaders. Divider effects don't arrive because stakeholders are irrational, they emerge because stakeholders interpret the same institutional conduct through different expectations and different interpretations of what that conduct means.

Consider the recent fight over PFAS in cookware which shows how divider effects form around the same institutional choice.[817] PFAS, short for per- and polyfluoroalkyl substances, are a large family of synthetic chemicals used for decades because they resist heat, water, grease, and stains.[818] They appear in products ranging from waterproof clothing and food packaging to firefighting foam and nonstick cookware. The concern is both environmental and health related.[819] Many PFAS break down

extremely slowly, earning them the label "forever chemicals".[820] This allows them to persist and accumulate in water, soil, animals, and people for decades.[821] Research has associated certain PFAS with cancers, immune effects, reproductive harm, and other health problems.[822] These concerns led California lawmakers to pass Senate Bill 682 in 2025, which would prohibit the sale of cookware containing intentionally added PFAS beginning in 2030.[823] Supporters, including environmental and public-health advocates, framed the restriction as a precautionary effort to prevent additional exposure and environmental contamination.

But not all stakeholders viewed the issue the same way. Celebrity chefs, including Rachael Ray, argued that nonstick cookware is safe and effective when manufactured and used at responsible temperatures.[824] Environmental Working Group and Clean

Water Action responded publicly, arguing that nonstick cookware should be replaced with safer alternatives.[825] The disagreement therefore produced two increasingly distinct narratives. One emphasized precaution, persistence, and eliminating avoidable exposure. The other emphasized appropriate use, product performance, affordability, and the danger of regulating a broad chemical class without distinguishing application and proper use.

Division can occur within the same stakeholder group as well. In this case governance stakeholders were divided on how to proceed with the PFAS issue. California legislators passed Bill 682, but Governor Gavin Newsom vetoed it.[826] His veto said he shared the goal of phasing out PFAS but was concerned that the bill could sharply reduce the availability of affordable cookware.[827] The divider effect therefore left stakeholders with competing signals about what responsible conduct actually required. Removing PFAS could be interpreted as protecting health and the environment, while preserving nonstick cookware could be interpreted as protecting

affordability and access to practical cooking products. For stakeholders without the expertise to independently evaluate the chemistry, competing claims from celebrity chefs, environmental advocates, manufacturers, scientists, legislators, and government officials also complicated the question of whom they could trust.[828] The divider effect left some stakeholders uncertain which narrative best represents their interests. It also left differing stakeholder expectation gaps that made it difficult for manufacturers to align with.

Divider effects can also harden into constraint rings when disagreement among powerful stakeholders begins to narrow the choices available to leadership. Emmanuel Faber's tenure at Danone provides an example of how that pressure can produce an internal clampdown. As CEO, Faber made Danone one of the most visible advocates of stakeholder capitalism, advancing its "One Planet. One Health" strategy and, in 2020, making it the first publicly listed French company to adopt Société à Mission status, formally embedding social and environmental objectives into its governance.[829] The move initially received overwhelming shareholder support.[830] But as Danone's growth

and margins lagged competitors, activist investors began arguing that management had allowed purpose and sustainability ambitions to distract from financial performance and execution.[831] The values themselves had not changed, but stakeholder expectations had shifted. Underperformance changed their beliefs and it gave critics a competing narrative through which to reinterpret the same values-driven conduct. Investor pressure intensified, governance tightened, and the board initially attempted to stabilize the situation by separating the chairman and CEO roles.[832] Within weeks, Faber was removed from both.[833] What some stakeholders continued to admire as principled long-term leadership became, for others, an accusation that management had allowed purpose to come at the expense of performance.

Emmanuel Faber's experience at Danone illustrates the reciprocal relationship between values and expectations. Faber was not merely applying an established

corporate value system.[834] He was helping move Danone toward a more explicit stakeholder-oriented model built around sustainability, long-term value, and broader social responsibility. Those commitments created new expectations among supporters and critics alike. When Danone's financial performance weakened, activist investors reinterpreted the same values-driven direction as evidence of inadequate execution.[835] The issue was not simply that Danone lacked values or that Faber ignored stakeholders. The deeper challenge was that a new values orientation had created expectations that the company had not yet demonstrated it could satisfy across its most consequential stakeholder groups.

The objective is therefore not universal stakeholder alignment. In a sufficiently large and diverse stakeholder ecosystem, that is rarely possible. The challenge is to create enough coherence between institutional values and stakeholder expectations that choices and conduct remain predictable and understandable, even when disagreement persists. But the difficulty of maintaining that coherence becomes

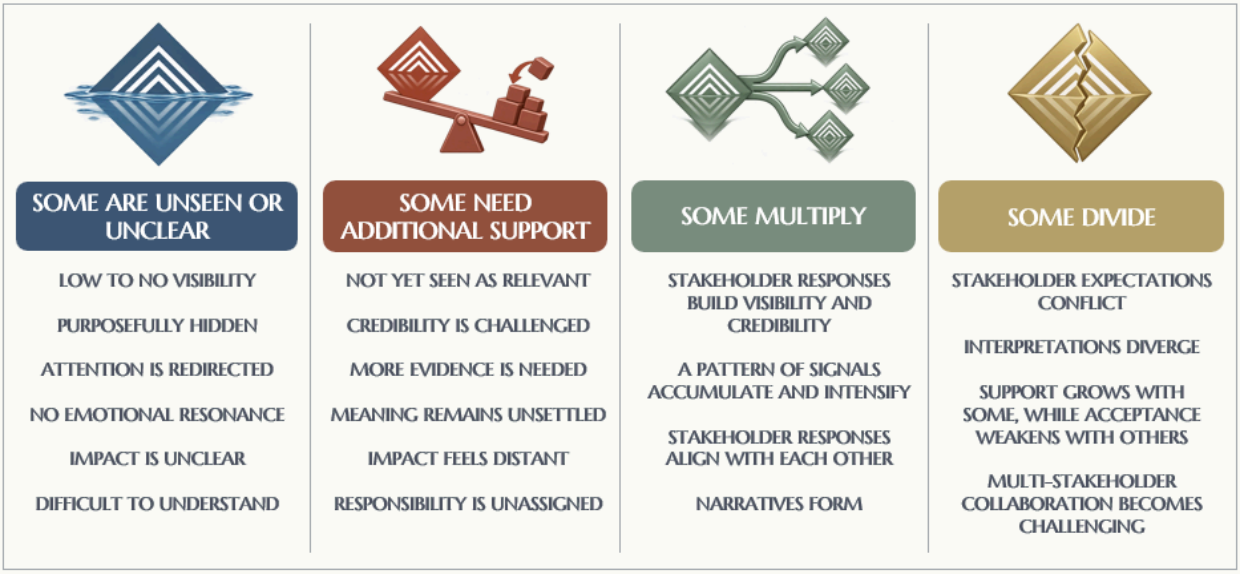
clearer when we consider how signals actually move through the stakeholder ecosystem. Not every signal becomes visible, not every stakeholder interprets it in the same way, and not every interpretation produces a response. Some signals disappear into the noise of the environment, while others remain latent until new evidence, changing circumstances, or the actions of other stakeholders make them consequential. Some accumulate and multiply as stakeholders reinforce one another's concerns or support, while others divide stakeholders around competing expectations of what responsible conduct requires. These pathways are neither fixed nor mutually exclusive. A signal that initially attracts little attention may later accelerate, a multiplier may give rise to division, and different stakeholders may experience these dynamics simultaneously. What begins as a single institutional choice can therefore produce multiple, overlapping patterns of judgment and response, each developing at a different pace and carrying different consequences for the institution.

DOWNLOAD THE BOOK PROPOSAL

Not All Signals Travel the Same Path



Reputation judgment is forged within this constantly evolving and dynamic signal environment. The challenges it presents to institutions are threefold. First, institutions can shape communications and conduct to build perceptions of integrity and prosperity, but they cannot control whether these signals will gain visibility or how stakeholders will interpret their intended meaning. Second, in an increasingly fast-moving, volatile, and polarized environment, understanding how stakeholder expectations form, evolve, and influence one another becomes more difficult. Third, the signal environment can create misleading impressions that lead institutions to assume that stakeholder silence represents acceptance, that growing attention guarantees reputational harm, or that disagreement necessarily means legitimacy has been lost.

DOWNLOAD THE BOOK PROPOSAL

The movement of signals through the stakeholder ecosystem is therefore difficult to anticipate, and the reputational consequences that emerge are not always immediately apparent. What is more certain is that the judgments stakeholders form ultimately influence their willingness to collaborate with the institution.[836] Some signals strengthen the credibility and confidence that make collaboration possible, while others introduce doubt, resistance, or competing demands that make collaboration more difficult to sustain. The consequences of reputation therefore extend beyond what stakeholders perceive or say about an institution. They emerge in what stakeholders are willing to do with it, for it, and sometimes against it.

Chapter 9: Reputation Economics

Passage 28: Willingness to Act

Quote Text (Placed on the section break page): *"Who steals my purse steals trash... But he that filches from me my good name / Robs me of that which not enriches him / And makes me poor indeed." — Iago, Othello, Act III, Scene 3*

Summary Text (Not Included in Final Copy): Reputation changes the conditions under which stakeholders choose to engage with an institution, but continued behavior does

DOWNLOAD THE BOOK PROPOSAL

not always reveal genuine willingness. Sales, retention, investment, or participation can persist because of dependency, switching costs, limited alternatives, or other forces, creating a collaboration paradox that can make weak stakeholder relationships look healthier than they are. This is why reputation outcomes are better understood through stakeholder willingness than through downstream measures such as revenue, stock price, or market valuation, which are shaped by many other forces and can influence reputation in return. Strong reputation creates more favorable conditions for stakeholders to support, tolerate, enable, or sustain the institution, while weak reputation makes those relationships more guarded, conditional, expensive, and fragile. The most practical way to capture that value is through two broad capacities, Influence, which expands what stakeholders are willing to do with and for the institution, and Resilience, which reflects how durable that willingness remains when the relationship comes under pressure.

Reputation is formed through the judgments of how well an institution meets the expectations of stakeholders. This judgement is derived through an interpretation of signals, which arrive as stories and other observable indicators, often through the choices and conduct that institutions make. It is this evaluation that shapes the conditions where stakeholders choose to collaborate with, support, or withdraw from the institution. An institution's reputation shapes the conditions under which an

DOWNLOAD THE BOOK PROPOSAL

employee decides whether to stay when negative signals emerge about the company's future, how much uncertainty an investor is willing to tolerate, whether a customer seeks further evidence after allegations arise, how readily suppliers commit resources, and how much discretion regulators are willing to grant.[837] Reputational damage often accompanies a legitimacy failure, when an institution falls short of the social, moral, or legal expectations to which stakeholders hold it accountable.[838] As the gap between expected and observed conduct widens, the institution becomes less predictable and reliable, and stakeholders respond by demanding greater assurances, imposing tighter conditions, increasing scrutiny, withholding support, or challenging the institution's license to operate.[839]

Reputation matters because it changes the terms on which stakeholders are willing to collaborate. A strong reputation lowers the price of collaboration,[840] while a weak

one raises it.[841] Reputation therefore does more than describe how an institution is perceived, it goes further to shape the latitude and durability of its operations.[842]

Collaboration, in the context of reputation, is best understood as stakeholder willingness. It describes the extent to which stakeholders are prepared to sustain, enable, tolerate, support, or participate in a relationship with an institution in ways that create value for the institution, the stakeholder, or both. Collaboration does not require complete consensus or harmony. Stakeholders may disagree with an institution and still choose to buy from it, work for it, invest in it, grant it permission, hear its argument, wait out uncertainty, or continue the relationship.[843] Reputation does not guarantee these behaviors. It influences how stakeholders respond and the terms and expectations they bring to the relationship. Nor does reputation guarantee financial outcomes such as revenue, stock-market value, or profit margins.[844] Instead, it strengthens or weakens stakeholder willingness to respond in ways that can contribute

DOWNLOAD THE BOOK PROPOSAL

to sustained, long-term organizational performance.[845] Where reputation is strong, collaboration tends to be quicker and less conditional,[846] and where it is weak, the same relationships become slow, guarded, and costly to maintain.[847] Reputation, as a result, is the currency through which stakeholder judgments of an institution's integrity and prosperity convert into influence and resilience.

One useful way to understand these different forms of collaboration is through Albert Hirschman's framework of exit, voice, and loyalty.[848] Stakeholders who become dissatisfied with an institution do not all respond in the same way. Some withdraw when alternatives are available. For example, a dissatisfied employee finds work at another organization. Others may remain in the relationship but contest, complain, advocate for change, or attempt to influence the institution from within or outside it. Still others go along with the relationship for now, waiting for a chance to challenge it or leave. These responses are shaped partly by the strength of the relationship, the

alternatives available, and the costs of leaving.[849] The difficulty is that continued collaboration is often misunderstood as genuine support. Stakeholders may remain in a relationship even when the institution is failing to meet important expectations, creating a collaboration paradox. This paradox enables institutional leaders to interpret continued behavior, such as sales, retention, or participation, as evidence of a strong reputation or genuine loyalty when other forces may be keeping the relationship intact[850]. Employees may stay because comparable jobs are scarce.[851] Customers may continue buying because switching is difficult or alternatives are limited.[852] Suppliers may accept unfavorable terms because too much of their business depends on a single buyer.[853] In each case, the relationship continues, but the willingness underlying it may be constrained by dependency, switching costs,

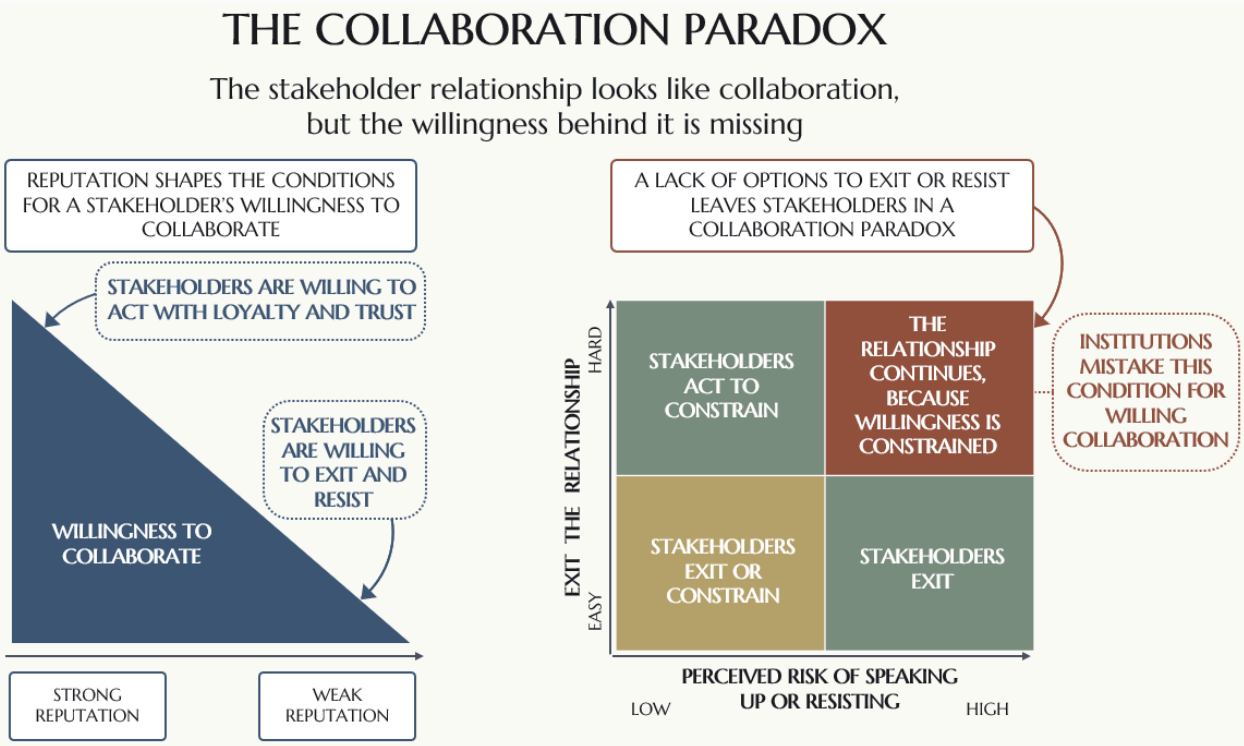
incentives, necessity, habit, or lack of alternatives. What appears to be collaboration can therefore mask a much weaker reputation than behavior alone suggests.



The collaboration paradox can become especially difficult to see when institutions treat customer sales as a proxy for reputational strength. Companies learned to become customer-centric for good reason, but purchasing behavior does not necessarily reveal the health of the relationship behind it, much less the health of the wider stakeholder ecosystem.[854] Ticketmaster provides a useful example. When

demand for Taylor Swift's Eras Tour overwhelmed the platform in 2022, Ticketmaster still sold roughly two million tickets in a single day even as its website failures, long waits, fees, and frustrated customers generated widespread backlash and congressional scrutiny.[855] The commercial activity continued because many fans who wanted access to the concerts had few practical alternatives, making continued purchasing a poor proxy for either satisfaction or reputation.[856] The same tensions with Ticketmaster extended beyond customers. In 2024, the U.S. Justice Department and a coalition of states sued Live Nation and Ticketmaster, alleging that their market power harmed fans, artists, venues, and competing promoters across the live entertainment ecosystem.[857] The lesson revealed is that strong marketplace demand does not prevent collaboration from becoming constrained elsewhere. This serves as a reminder that when sales are viewed as a proxy for reputational health, the deterioration of broader stakeholder collaboration becomes invisible.

A related problem emerges when institutions mistake the strength of one stakeholder relationship for the broader health of their reputation as a whole. A culture fixed on customer obsession can be an effective way to shape a competitive advantage, but it also presents the tendency to evaluate reputation primarily through the lens of the people who buy their products, omitting the broader stakeholder ecosystem.[858] Take for example Chinese founded global fast-fashion retailer, Shein, which built its rapid growth around an intensely customer-focused proposition centered on low prices, enormous selection, and a near-constant introduction of new styles.[859] Its model proved remarkably effective at attracting consumers, particularly younger shoppers, and helped turn Shein into one of the world's largest online fashion retailers.[860] But a focus on customer purchase behavior would conceal the scrutiny the company was also facing over supplier labor practices, environmental impacts, and trade and regulatory issues.[861] This case study showcases the need to cast a wider net for

understanding the outcomes that reputation creates, beyond asking only whether customers are willing to buy.

This provides a key distinction that helps clarify what should, and should not, count as a reputation outcome. A reputation outcome is not the sale, revenue figure, or market valuation itself, but a measure of stakeholder willingness.[862] More specifically, a willingness to engage in behaviors that enable an institution to achieve its objectives.[863] It can be difficult to quantify the willingness of a stakeholder, as willingness is not an absolute concept.[864] The strength of stakeholder willingness can vary in intensity and may differ based on the context.[865] Consider how readily a stakeholder forgives a product failure compared with how readily they would excuse harmful treatment of employees or small businesses in the community. The understanding here is that a stakeholder's willingness to collaborate, scrutinize, or withdraw is often contextual.

This presents one of the greatest challenges to building and defending the resources and infrastructure that reputation requires. Institutional leaders often seek to quantify the value of reputation through measures such as revenue growth, profit margins, stock price, market valuation, favorable media outcomes, or new market entry. But what these leaders often miss is that those performance measures sit farther downstream from the outcomes that reputation more directly influences.[866] Reputation can strengthen operational capability and capacity inside the institution, improve exchange and access across the external marketplace, and create greater latitude in the rules, permissions, scrutiny, and accountability under which the institution operates.[867] When those conditions are favorable, an institution is significantly better positioned to achieve its objectives and, as a result, stronger organizational performance becomes much more likely.[868] Metaphorically, reputation can put wind in the sails, but it is not the only force that determines whether the ship reaches its destination.

What can cause confusion is the mutual nature of the relationship between reputation and organizational performance. Academic research has repeatedly found that strong organizational performance can influence reputation, sometimes more clearly than reputation can be shown to influence later financial performance.[869] Strong growth, reliable execution, and successful products become signals of competence and capability. Weak performance can produce the opposite effect leading stakeholders to revise their beliefs, change their expectations, and reconsider earlier judgments of the institution. The relationship between reputation and organizational performance is therefore reciprocal rather than linear.[870] Reputation is also more than a reflection of past success, since research suggests that when two firms have performed equally well, the one with the stronger reputation tends to sustain its performance longer. [871] At times the two reinforce one another, at times they diverge, and at times one trails the other. Attempts to assign reputation a precise share of stock price or market value are therefore both tempting and difficult

to defend.[872] Instead institutional leaders are better served by focusing less on proving that reputation directly produces organizational performance and more on understanding how a strong reputation creates the conditions that help institutions achieve their objectives.

Assuming a direct link between reputation and financial performance can be challenging at best, problematic at worst. Consider the surge in energy profits during the 2026 U.S.-Iran conflict.[873] Disruptions to global energy markets and shipping through the Strait of Hormuz drove oil prices sharply higher.[874] Glencore, the commodity trader, for example, reported $2.66 billion in adjusted energy-trading earnings during the first half of 2026, compared with just $40 million during the same period a year earlier.[875] Investors could interpret stronger earnings as evidence of resilience, market capability, and superior execution. Consumers facing higher cost

of living could interpret the same profits through questions of fairness and proportionality. Activists or policymakers could ask whether extraordinary gains created a greater burden to societal wellbeing.[876] This is the reputation divider effect, which was covered in the previous chapter, at work. In this case stakeholders interpret financial performance with revised expectations and potentially widening expectation gaps. This shows how financial performance can improve, but how the institution earned those profits, the negative externalities that potentially rose from those profits, and the decision of what the institution does with these profits can lead to potential reputation risk. The key takeaway is that financial performance can trend positively, while reputational strength with some stakeholder trends negatively at the exact same time.

The speed at which financial markets react to external forces also reveals that stock performance has little to do with the reputation of individual institutions. After the Trump administration announced sweeping global tariffs in April 2025, the S&P 500 fell sharply, losing roughly $5 trillion in market value over two days.[877] When most tariffs were paused days later, the index surged 9.5 percent in a single session while the Nasdaq jumped 12.2 percent.[878] Similar threats and reversals involving China, the European Union, Federal Reserve leadership, and later Greenland repeatedly moved

markets, eventually giving rise to the coined term (a symbolically compressed label) TACO, or "Trump Always Chickens Out," trade. Subsequent rounds of tariff threats and reversals moved markets in similar fashion.[879] The reputations of hundreds of companies had not deteriorated and recovered by double-digit percentages within days. When external forces can move entire markets this aggressively, stock performance becomes an exceptionally noisy proxy for reputational outcomes..

Nvidia demonstrates another challenge with linking financial performance to reputation outcomes. In August 2024, the company reported quarterly revenue of $30 billion, up 122 percent from the previous year, which exceeded Wall Street's earnings expectations, in addition the company announced an additional $50 billion share-buyback authorization.[880] A buyback allows a company to repurchase its own shares and is generally intended to return capital to shareholders while reducing the number of shares outstanding, which can support the share price.[881] Yet Nvidia's stock

fell about 6 percent after the announcement. Investors were not reacting to poor performance.[882] They were reacting to performance that, while extraordinary, failed to exceed the even higher expectations that had become embedded in the stock price prior to the announcement.

The example creates a dilemma for anyone attempting to use financial metrics as a proxy for reputation. Concluding that Nvidia's reputation strengthened because revenue grew 122 percent, or weakened because its stock price declined, would be equally unsupported, since neither conclusion follows cleanly from the evidence. Stock prices incorporate expectations about the future alongside current performance, investor sentiment, valuation, and countless other signals.[883] Short-term market movements therefore cannot be treated as a real-time measure of reputational strength. Reputation may contribute to stronger performance over longer periods, but even then the relationship remains difficult to isolate because long-term financial

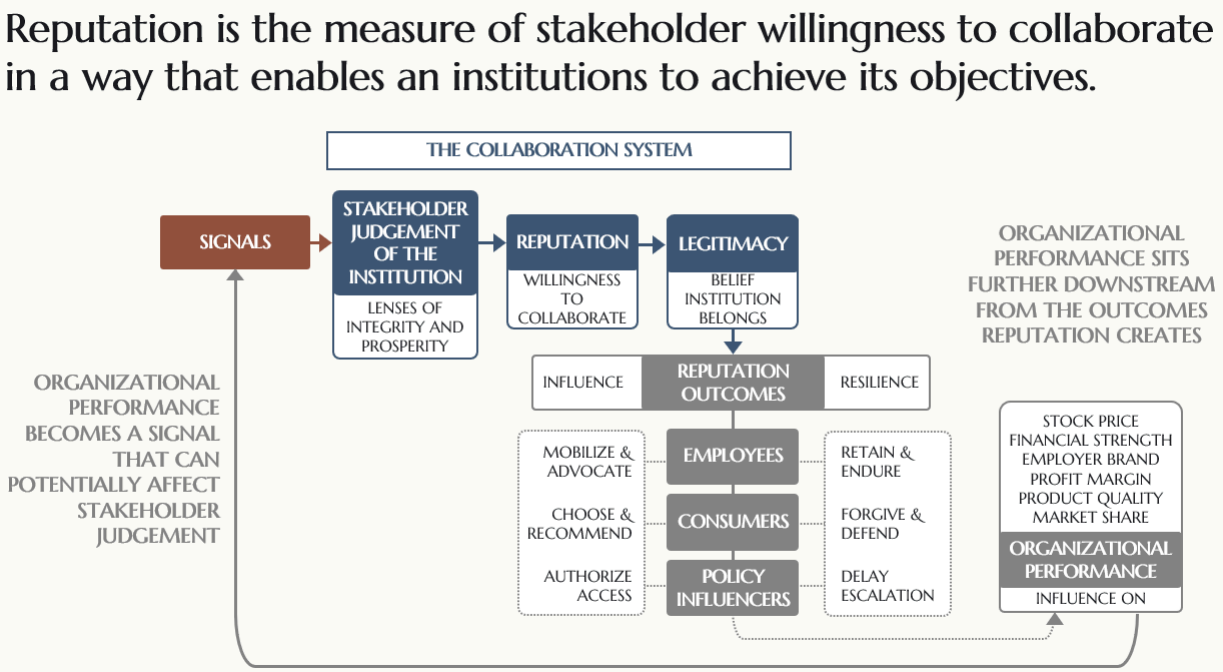
performance reflects far more than reputation alone.[884] This shows why a relationship can exist without one being a consistently reliable gauge for the other.



The better way to understand reputation outcomes is not to start with organizational performance. It is to start with the judgments that create reputation in the first place. Legitimacy and reputation develop together through the judgments stakeholders form of an institution over time.[885] Prosperity and integrity are the two judgment lenses that most directly shape whether an institution is seen as capable, reliable,

predictable, and worthy of continued collaboration. Those judgments accumulate into the institutional image stakeholders carry into future decisions of how they willingly choose to engage with an institution.[886] That image determines how much they are prepared to put into the institution, and how much they will be willing to put up with.[887] When the image is strong, the institution creates more favorable conditions for reputation outcomes to emerge, increasing the likelihood that those outcomes eventually contribute to stronger organizational performance.[888] The practical advantage is that institutions can focus on what they can influence most directly, aligning their choices and conduct with stakeholder expectations rather than trying to isolate and measure the many forces that determine organizational performance that is further downstream from stakeholder collaboration.

But expecting institutional leaders to sustain investment in reputation requires more than asking them to monitor judgments, expectations, and stakeholder perceptions. Reputation must connect to outcomes that make its value not only understandable,

but highly desired inside the institution. Without that connection, it becomes much harder to defend the people, systems, research, governance, and other infrastructure resources required to build and protect it.[889] The challenge is that reputation can influence thousands of different stakeholder responses across industries, institutions, and marketplace circumstances, which makes an exhaustive catalogue neither practical nor especially useful.[890] What leaders need is a simpler way to understand what those outcomes ultimately provide. Across the range and depth of outcomes, reputation can be reduced to providing two broad strategic capacities.

The first is influence, the degree to which reputation widens what stakeholders will do on an institution's behalf. The second is resilience, which reflects the durability of that willingness when the relationship comes under pressure. Evidence from Integral's 2026 Integral Index Report offers an illustration of how these capacities begin to develop internally.[891] The report found that employees who perceived more integrity-related behaviors were substantially more likely to view change communications as consistent

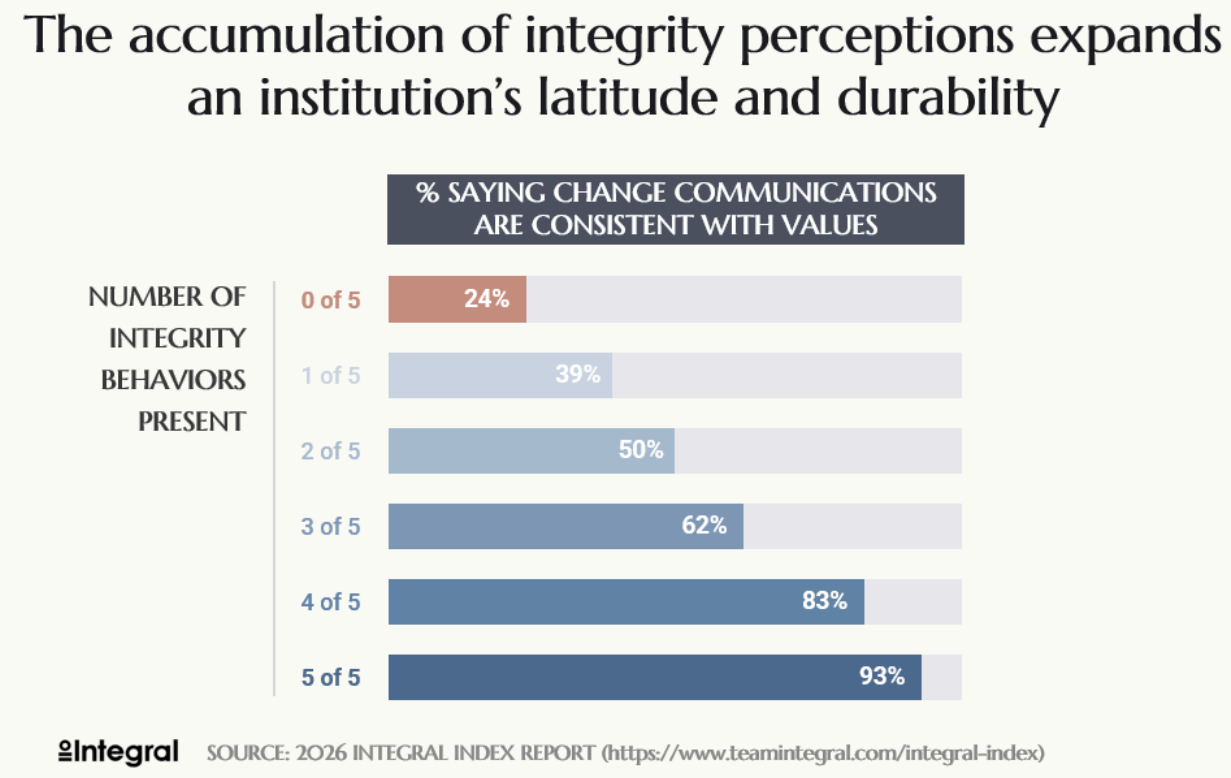
with organizational values. This suggests that when institutions consistently reinforce perceptions of integrity, they create greater latitude to communicate and implement change, while strengthening the durability of the relationships required to navigate uncertainty, scrutiny, and setbacks. Together, influence and resilience provide a more practical way to understand what reputation delivers and how it can create conditions that support organizational performance, without claiming that reputation alone produces the entirety of those downstream results.



DOWNLOAD THE BOOK PROPOSAL

Passage 29: Latitude and Durability

Summary Text (Not Included in Final Copy): Influence and resilience provide a practical way to understand what reputation produces by focusing on how stakeholder willingness expands and how durable that willingness remains under pressure. Influence gives institutions greater latitude by increasing the likelihood that stakeholders will contribute, support, permit, invest, or collaborate beyond minimum requirements, while resilience reflects the reserve of goodwill that can preserve those relationships when new evidence gives stakeholders reason to reconsider them. Because both outcomes can be obscured by dependency, switching costs, latency, and other forces, they are best understood at the level of specific stakeholder relationships rather than collapsed into a single institutional score. Across those relationships, reputation can strengthen internal operational capability, expand external marketplace access and continuity, and increase the permissions and discretion granted by institutional stakeholders. When those benefits converge, reputation becomes a source of both greater room to act and greater durability when the institution comes under pressure.

DOWNLOAD THE BOOK PROPOSAL

A strong reputation creates influence with stakeholders. Consumers recommend it to friends, try whatever it launches next, and pay a premium without shopping around.[892] Employees refer job openings to people they know, put in effort no one asked for, and defend the institution in conversations outside of work.[893] Investors back long-horizon strategies, partners share plans before they are final, and communities welcome a new facility rather than organizing against it.[894] The behaviors look different because stakeholders control different resources and respond in different ways, but the reputational outcome they share is greater influence.[895] By setting a clear long-term direction and creating greater coherence around what stakeholders could expect from the company, Polman helped build influence across multiple stakeholder relationships.[896] As Unilever built its reputation it gathered greater influence which

created the conditions that supported broader organizational performance.[897] At its strongest, this is what influence provides. It gives an institution greater room to move because more stakeholders are willing to move with it.

Toyota shows influence as an advantage with suppliers that extends beyond the terms of written contract.[898] The company has built a supplier network around long-term relationships, shared learning, continuous improvement, and the expectation that Toyota and its suppliers all benefit from one another's success.[899] Suppliers do more than deliver components, they share information, participate in problem solving, invest in process improvements, and contribute knowledge across a tightly connected production system.[900] Research has found that Toyota's suppliers have historically reported higher levels of trust and have achieved greater operational improvements

than major U.S. automakers.[901] The distinction is important because Toyota does not force stakeholder collaboration into existence. The incentive of shared success is not contained in the contract alone. It is driven by a willingness to collaborate because shared knowledge is viewed as improving the wider system of collective success.[902] This is the dynamic that Toyota created, a drive to willingly collaborate beyond contractual requirements. This gives Toyota enhanced access to capabilities distributed throughout its partner network rather than contained within Toyota itself.[903] Influence in this case is more than another sale or a higher reputation score, it is a stakeholder ecosystem willing to contribute more to the relationship, which helps Toyota coordinate, improve quality, and innovate across its supply network, an advantage researchers have linked to the contribution of its suppliers.[904]

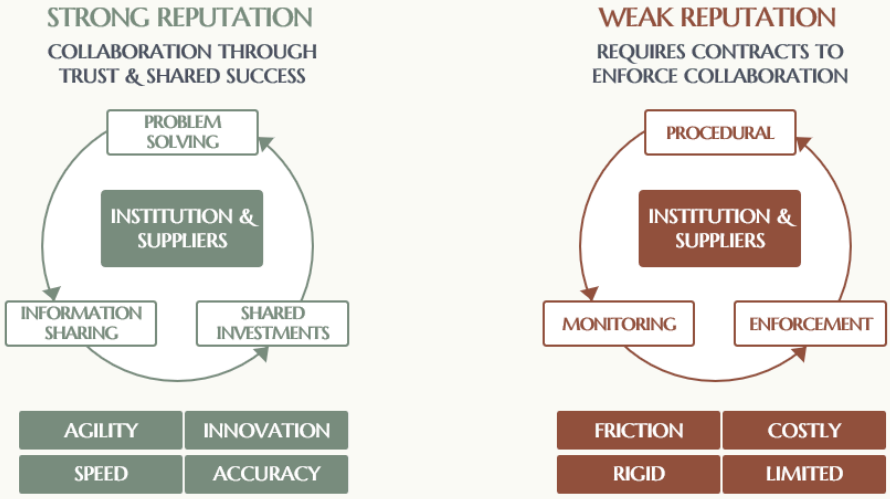
Reputation creates influence, which gives an institution greater latitude to move collectively with its stakeholders.



Influence greatly elevates what stakeholders are willing to do, but that willingness is not always easy to observe cleanly. When a stakeholder faces a Collaboration Paradox their behavior can look like loyalty, but a closer look may reveal that they are constrained in behaviors that look like collaboration. Resilience, the other major outcome of reputation, therefore provides a more revealing reputation test when the relationship comes under pressure.[905] If influence is how far stakeholders will go with an institution, resilience is whether they keep going once they have a reason to stop. A strong reputation creates resilience by giving stakeholders greater confidence in the institution even when its choices and conduct do not cleanly align with their

expectations.[906] That resilience can appear as patience, continued engagement, willingness to hear an explanation, benefit of the doubt, forgiveness, or delayed withdrawal while stakeholders determine whether new evidence materially changes their beliefs, casts new judgement, and resets the perceived legitimacy of the institution.[907] In this sense, a strong reputation does more than create influence. It creates a reputational shield that can protect stakeholder collaboration during periods of disruption.[908]

Costco's famous $1.50 hot dog provides an unusually simple example of how resilience can accumulate long before an institution needs it. Its importance lies not in the price of the food itself, but in what the hot dog symbolizes. Costco has kept the price unchanged since 1984, despite inflation and repeated opportunities to charge more.[909] Refusing to raise the price signals a willingness to protect the customer

relationship rather than maximize every possible margin.[910] It is a compressed expression of institutional values that allows stakeholders to interpret Costco's broader conduct. That signal becomes more powerful alongside other choices, including Costco's longstanding reputation for comparatively strong employee treatment.[911] Together, these choices reinforce the perception that Costco behaves with consistency and restraint. As reputational strength accumulates, the institution gains resilience, which becomes vital when a negative event, unpopular decision, or price increase gives stakeholders reason to reconsider their judgment.[912] Resilience means that new signals are not interpreted in isolation. They are weighed against prior experiences and beliefs formed through a consistent pattern of choices and conduct. Simply put, new signals must compete with years of accumulated evidence to dislodge an existing judgment. The $1.50 hot dog is part of that evidence, a familiar reminder of how Costco has chosen to behave when it could have behaved differently. That cushion gives stakeholders greater reason to extend patience and the

benefit of the doubt before concluding that a new event fundamentally changes what they believe about the institution.[913]

Costco shows how resilience can be accumulated long before an institution needs to draw on it, while GitLab shows how it can quickly be earned at the moment of a high pressure decision. The technology platform company had built strong expectations around openness and transparency with its user community.[914] On January 31, 2017 an engineer accidentally deleted production data and the company discovered that several backup systems had also failed.[915] The failure gave users reason to question GitLab's competence, but the choices the company would make to respond to the issue would give its customers additional evidence to confirm the integrity it had earned. GitLab published frequent updates, openly documented what had gone wrong, and even livestreamed parts of the recovery process as engineers worked to restore the service.[916] Its conduct matched what users had expected the company to

DOWNLOAD THE BOOK PROPOSAL

Neither influence nor resilience can be measured with complete precision. Influence is hard to isolate because the same visible behavior can reflect genuine willingness or a simple lack of options. Resilience presents a different measurement challenge. It often becomes visible only when a decision test gives stakeholders a real reason to walk away.[919] Until that moment arrives, an institution may appear to possess substantial goodwill without knowing how much cushion it actually holds. Even after disruption, the fact that stakeholders refrained from acting against the institution does not provide a complete answer. They could be locked in a collaboration paradox or they could be drawing down on reputational equity, quietly accumulating legitimacy debt.

[919] Linnenluecke, M. K. (2017). Resilience in Business and Management Research: A Review of Influential Publications and a Research Agenda. *International Journal of Management Reviews*, *19*(1), 4–30. https://doi.org/10.1111/ijmr.12076

DOWNLOAD THE BOOK PROPOSAL

In that sense, goodwill resembles a reserve whose true value becomes visible only when it is drawn upon. Even then, it can be challenging to determine if the reserve is being replenished or depleted.

These limitations do not make influence and resilience poor measures of reputation, only measures that must be interpreted over time.[920] Because they sit closest to the conditions under which stakeholders choose to collaborate or withdraw, they offer a more direct reading of reputation than the financial and operational outcomes further downstream, despite the noise, uncertainty, and latency they contain.[921] Read together and over time, they provide evidence of reputational strength, direction, and outlook.

The potential ambiguity of measuring influence and resilience creates an important requirement for understanding reputation economics. Reputation outcomes become more interpretable, and more easily quantifiable, when examined at the level of the

stakeholder relationship rather than collapsed into a single outcome for the institution as a whole.[922] Different stakeholders hold different views of an institution and possess different capacities to collaborate with it or constrain it.[923] Looking at those relationships separately does not fully eliminate the attribution problem, but it reduces some of the noise by narrowing the question to the forms of willingness and behavior that matter within a particular stakeholder group. The economic contribution of reputation then becomes clearer when institutions evaluate specific benefits reputation creates among each stakeholder.

The benefits of reputation outcomes tend to cluster in surprisingly consistent ways across major stakeholder groups. Among internal stakeholders, a strong reputation provides the benefits of enhanced operational capability and capacity.[924] This makes internal stakeholders more willing to join, stay, coordinate, innovate, adapt,

operate more freely, and reputation also reinforces organizational durability, which protects that license to operate, when the institution comes under pressure.[930]

Internal stakeholders can become one of the clearest sources of resilience when an institution comes under pressure.[931] Employees possess the ability to preserve knowledge, adapt operations, maintain productivity, and contribute discretionary effort when normal conditions break down.[932] Malden Mills provides a powerful example of what can happen when that willingness has been earned before a crisis arrives. Malden Mills was a family-controlled Massachusetts textile manufacturer best known for creating and producing Polartec fleece.[933] On December 11, 1995 an explosion triggered a massive fire that destroyed several buildings, injured 33 people and left approximately 1,400 employees out of work just two weeks before Christmas.[934] Owner and CEO Aaron Feuerstein faced a decision. He could have taken

the insurance proceeds, downsized, and followed the trend of offshoring production. But instead, he committed to rebuilding, supporting employees and the local community. With that commitment he continued employee pay, provided health benefits, honored Christmas bonuses, and provided additional food assistance.[935]

Feuerstein later recalled employees telling him they would repay that commitment "tenfold."[936] Within eleven days, employees had helped restore surviving production capacity, putting approximately 300 people back to work[937]. As operations recovered, employees reorganized production and improvised around the damaged facilities. Within weeks, the operation was reportedly producing approximately 200,000 yards of fabric per week, compared with roughly 130,000 before the fire, an increase of more than 50 percent.[938] More than 90 percent of displaced workers eventually returned to Malden Mills, despite some receiving job offers elsewhere.[939] Feuerstein

protected his employees when the relationship was under pressure, and they reciprocated through loyalty, adaptability, increased output, and a determination to rebuild. Reputation had accumulated before the fire and the decision test revealed the power of what that relationship could achieve.

External stakeholders commonly turn a strong reputation into brand choice and commercial growth when an institution's conduct reinforces the values that people already believe it has.[940] REI demonstrated this in 2015 with #OptOutside.[941] The outdoor co-op had spent years supporting conservation organizations, expanding access to outdoor recreation, and making environmental stewardship part of its institutional commitments.[942] Then it closed all 143 REI stores on Black Friday, paid employees to take the day off, and encouraged customers to spend the day outdoors rather than shop.[943] The reputational significance was not simply that REI promoted

the outdoors or that it closed its doors. It chose to voluntarily surrender one of retail's biggest selling days to demonstrate that its conduct aligned with values that its stakeholders had come to expect. The decision reinforced an image of REI as an institution that was willing to enact its values, even if it meant trading off against short-term profits. Customers responded with a greater willingness to collaborate. In 2015, more than one million new members joined REI for the first time in its history, revenue increased 9.3 percent to $2.4 billion, comparable sales rose 7 percent, and digital sales grew nearly 23 percent.[944] #OptOutside did not prove that reputation caused those results, but it showed how consistent institutional conduct can reinforce stakeholder preference while strong commercial performance continues alongside it.

One vitally important benefit of a strong reputation among institutional stakeholders is the access and permission they can provide for an institution to expand, transform, and pursue new opportunities.[945] Ørsted provides a powerful example. In 2008, when the company was still DONG Energy, 85 percent of its heat and power production came from fossil fuels.[946] Rather than simply promising a transition, the company made that transition observable. It abandoned new coal projects, closed fossil assets, redirected capital toward renewables, sold its oil and gas business, and built the technical capability to develop offshore wind at scale.[947] Those choices gave institutional stakeholders an evidence trail of both commitment and capability, strengthening Ørsted's legitimacy as a credible participant in the energy transition. The result was repeated access to projects that depended on government consent, planning approval, and institutional collaboration.[948] Hornsea One became the first offshore wind farm to exceed one gigawatt of capacity, which can power more than

one million UK homes.[949] That relationship continued to scale. Hornsea Three is now an £8.5 billion infrastructure project expected to power more than 3.3 million homes. Ørsted could not grant itself those opportunities.[950] Its transformation helped establish the credibility that governments and planning authorities look for when approving sites and supporting future projects, even though many contracts are ultimately awarded through competitive auctions.[951] That credibility has not insulated the company from difficulty, as rising costs and policy shifts led it to cancel Hornsea Four in 2025 and to absorb significant losses in the United States.[952] The distinction is instructive, because legitimacy can secure access to opportunity without guaranteeing the economics of every project.

Passage 30: The Cost of Collaboration

Summary Text (Not Included in Final Copy): Reputation creates economic value by shaping whether stakeholders are willing to support, tolerate, enable, or constrain an institution, even when that contribution cannot be cleanly separated from the many other forces influencing performance. This creates an important asymmetry because reputation's positive contribution is often debated while it is working, yet its value becomes much easier to recognize once stakeholder confidence deteriorates and reputational harm appears. Reputation risk therefore requires institutions to look beyond current standing and identify consequential expectation gaps before they become visible costs, while the Reputation Tax shows that every reputational position carries some form of burden through friction, infrastructure, expectations, or contradiction. When pressure intensifies beyond the institution's normal capacity to absorb and respond, reputational harm can cross a threshold into crisis. The practical implication is that institutions must understand and act on stakeholder expectations early enough to preserve influence and resilience before those expectations harden into resistance, formal constraints, or rules.

DOWNLOAD THE BOOK PROPOSAL

The positive outcomes that reputation creates are as vast and wide as the stakeholder ecosystem that influences it. But the translation of those outcomes into a precise financial contribution creates an important economic asymmetry. Models exist that can estimate the additional value reputation contributes,[953] and those efforts are useful because quantification can help institutions justify greater investment in reputation.[954] As covered previously, the contribution to overall performance is often diffuse and challenging to accurately establish. When goals are being met, profits are strong, talent is easy to attract, regulators remain constructive, and investors are content, there is plenty of room to debate how much of that success should be credited to reputation. This is because organizational success also attracts competing explanations from across the institution, each pointing to strategy, products, operations, marketing, legal compliance, market conditions, or other forces that helped produce the result.[955] Reputation is often a key part of that success, in some cases it may even be a substantial part of it.[956] But the challenge remains that the

further measurement moves downstream from observable stakeholder outcomes toward overall organizational performance, the more assumptions are needed to justify the calculation.

The other side of the reputation economics equation is far easier to see and quantify. It is the cost an institution bears when reputation deteriorates,[957] which becomes concrete and attributable as talent leaves, customers withdraw, projects stall, and regulators impose penalties.[958] This cost is reputational harm. It is not simply negative publicity or an unfavorable judgment, but the deterioration of the conditions that had previously made stakeholder collaboration easier. By the time those losses can be clearly observed, stakeholders have often been revising their judgments for some time, while the institution has been drawing down reputational equity and accumulating legitimacy debt. The result is an economic asymmetry, in which reputation's positive contribution remains contested while it is working, yet its value becomes difficult to dispute once harm visibly constrains performance.

Because reputational harm produces visible consequences and costs, institutional leaders often recognize reputation's impact only once the damage becomes measurable.[959] And while most understand that harm follows from a deteriorating reputational image, they often conflate reputational harm with reputation risk.[960] They are not the same. An institution's reputational image reflects its current standing with stakeholders, formed through their accumulated judgments of how it behaves against the expectations they hold.[961] Reputation risk looks forward. It concerns the

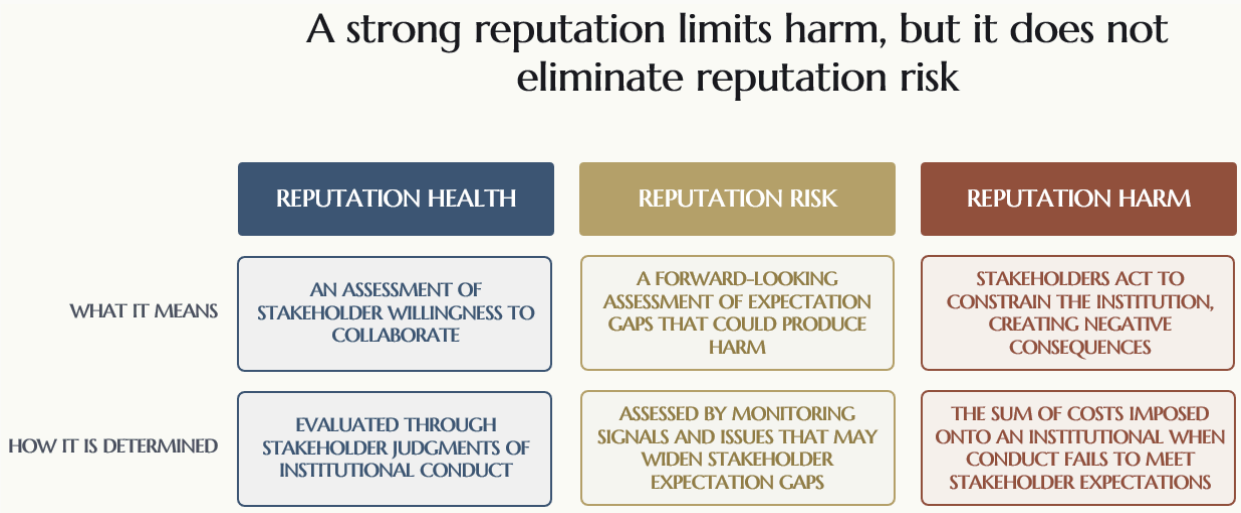
expectation gaps that could weaken stakeholders' willingness to collaborate if they widen or remain unresolved.[962] Reputational harm is what happens when those gaps become consequential and stakeholders begin to withdraw collaboration or impose costs and constraints. A strong reputational image therefore does not imply low reputation risk, and the two commonly coexist.[963]



Reputation risk is challenging to quantify because it is forward-looking.[964] It depends on signals generated by emerging issues, external events, institutional responses, and

the reactions of key stakeholders.[965] Those factors can change quickly, and their consequences are not always visible in advance. An issue that appears manageable may become more consequential as expectations shift, new information emerges, or other stakeholders intensify the pressure.[966] Reputation risk therefore cannot be assessed by looking only at the issue as it exists today. It requires attention to the conditions that could cause the issue to widen an expectation gap and weaken stakeholder willingness to collaborate.

The RISK framework evaluates those conditions across four dimensions. The first is responsibility, which accounts for the extent to which stakeholders believe the institution should prevent, address, or resolve the issue.[967] The second is importance, which is an estimate of how consequential the issue to stakeholders, and how directly it affects them. The more important and proximate the issue is, the more likely it is to

DOWNLOAD THE BOOK PROPOSAL

influence stakeholder expectations and increase reputational risk.[968] The third is stakeholder gap, which measures the distance between perceived institutional conduct and what stakeholders expect the institution to do. The wider the gap, the greater the potential for the issue to become reputationally significant. The fourth is know-how, which is the belief that the institution has the resources, authority, knowledge, and capability to manage the issue. When an institution is seen as capable of acting but fails to do so, there is an increased amount of risk attached to the issue.[969] Reputation risk becomes most significant when these four conditions converge. Under those conditions, an unresolved issue is more likely to weaken stakeholder willingness to collaborate and eventually produce reputational harm.[970] Reputation risk is therefore not determined by the issue alone. It emerges from the relationship between the issue, stakeholder expectations, perceived institutional conduct, and beliefs about the institution's responsibility and capacity to act. The framework does not predict exactly when reputational harm will occur. It helps identify where the conditions for that harm are accumulating.

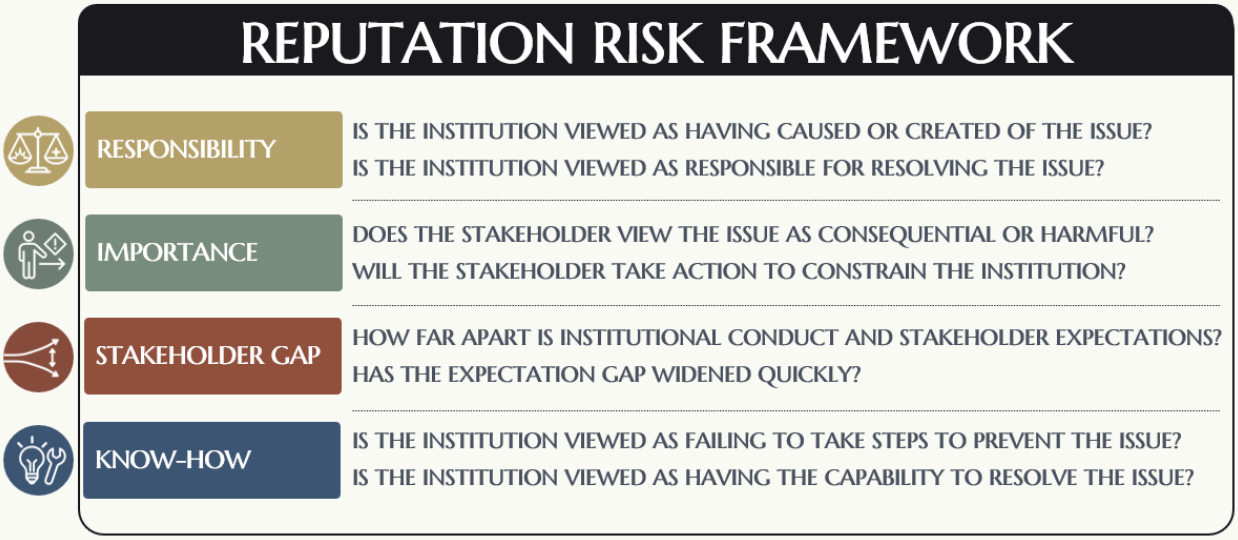
Reputation Risk Builds When Accountability, Consequences, Gaps, and Capability Converge



Blackbaud, a software technology company, shows how reputation risk can be identified before reputational harm materializes. The company develops fundraising, donor-management, online-giving, payment, and other software for nonprofit and social-impact organizations.[971] Customers entrust Blackbaud with sensitive donor information, placing the company under significant responsibility to protect it. That expectation is highly important because confidence in the security of personal and financial information helps sustain donors' willingness to engage with the organizations using those systems.[972] Stakeholders would also reasonably expect

Blackbaud to possess the know-how to safeguard that information, communicate transparently when problems arise, and demonstrate competence in resolving them.[973] Those conditions exist before any breach occurs, which creates a clear vulnerability if Blackbaud's conduct ever visibly fell short of stakeholder expectations. A high pressure decision arrived in 2020 when a ransomware attack removed data associated with more than 13,000 customers.[974] The breach exposed the existing expectation gap, but Blackbaud's response widened it further.[975] The SEC alleged that the company made misleading disclosures even after employees learned that sensitive information had been accessed, and Blackbaud agreed to pay a $3 million civil penalty without admitting or denying the findings.[976] The reputational risk was therefore not created by the penalty. Data security risk already existed as preset stakeholder expectations attached to Blackbaud's business. The event simply made that exposure visible, and the institution's subsequent choices amplified the reputational harm that followed.

DOWNLOAD THE BOOK PROPOSAL

The costs associated with reputation are commonly framed only in terms of reputational harm. What is misunderstood is that reputation always carries a cost, even when no harm is present. Consider an institution with a weak reputation. The organization carries the friction created when stakeholders become less willing to trust, participate, and collaborate with the institution. But there is also the cost of holding a strong reputation. Institutions that have earned a strong reputation now carry the cost of maintaining the dedicated resources required to continually earn and safeguard stakeholder collaboration.[977] Some institutions may appear to escape these costs when they invest little in reputation-related capabilities and performance remains strong. This is linked, of course, to a collaboration paradox, where market power, dependency, limited alternatives, or other conditions keep stakeholders collaborating. But one thing remains constant. When institutions underinvest in the practices and systems needed to meet stakeholder expectations, legitimacy debt can accumulate before its consequences become visible. Institutions can invest in building and sustaining a reputation and collect the influence and resilience it provides, or accept the friction, exposure, and constraints that come with neglecting it. In either case they pay, and the only choice that remains is what they pay for.

This creates a useful way to think about reputation as a tax structure. A weak reputation creates a friction tax as distrust increases scrutiny, verification, safeguards, negotiation, and the effort required to sustain collaboration. Building reputational strength requires an infrastructure tax, the investment in people, systems, stakeholder intelligence, governance, values, and other reputational muscle needed to earn legitimacy. A strong reputation creates an expectation tax as stakeholders expect the institution to maintain, and often advance, the conduct, commitments, and capabilities that produced that reputation.[978] When institutional conduct violates those accumulated expectations, a contradiction tax follows as stakeholders pull back, push back, or write new restrictions into a relationship they once extended freely.[979]

What becomes evident is that Institutions may be paying a reputation tax without fully recognizing it until the costs of reputational harm become visible. Strong commercial performance can make an institution appear healthier than its stakeholder relationships actually are, particularly when growth outpaces the infrastructure needed to govern it. This creates a velocity gap, covered in chapter one, where scale advances faster than the institution's ability to understand expectations, oversee conduct, and protect reputation. Boohoo, a British online fashion company, provides a useful example. The company expanded rapidly through a network of suppliers producing inexpensive clothing at extraordinary speed, but the infrastructure governing that network did not keep pace.[980] In 2020, an undercover

[980] Qc, A. L. (n.d.). *Independent Review into the boohoo Group PLC's Leicester supply chain*.

DOWNLOAD THE BOOK PROPOSAL

Sunday Times reporter entered a Leicester factory supplying Boohoo-owned brands and was told to expect £3.50 an hour, less than half the legal minimum wage.[981] The disclosure triggered scrutiny that an independent review commissioned by Boohoo largely validated, finding serious weaknesses in the monitoring and governance of its Leicester supply chain.

What followed was a friction tax. Next, ASOS, Amazon, and Zalando removed or suspended Boohoo products, while approximately £1.5 billion in market value disappeared within two days.[982] The company then had to strengthen supplier oversight, compliance, auditing, governance, and purchasing practices while simultaneously attempting to restore stakeholder confidence.[983] The infrastructure tax eventually had to be paid anyway, only now Boohoo was paying it while also absorbing the costs of scrutiny, resistance, and weakened trust. Even these visible costs

underrepresented the company's full reputation tax payment. Weak oversight of supplier labor practices also carried less visible costs, including fragile supplier relationships and continued exposure to future disruption, which are harder to quantify but still weigh on performance.[984] Those effects, at times, can be harder to observe and quantify, but they still reduce organizational performance.[985] The case provides a valuable lesson that where a velocity gap opens, the friction tax is simply waiting to be collected at a later point in time.

While a friction tax typically results from weak governance and poor stakeholder alignment, the expectation tax is different because it emerges from reputational success. Wegmans, a family-owned supermarket chain, has appeared on Fortune's 100 Best Companies to Work For list every year since the list began in 1998,[986] while 91 percent of employees surveyed by Great Place to Work say it is a great place to

work.[987] That reputation has been reinforced through decades of investment in employees, including scholarships, training, development opportunities, flexible scheduling, and benefits.[988] Since 1984, Wegmans has awarded more than $155 million in scholarships to over 49,500 employees, with approximately $6 million in tuition assistance expected during the 2025–2026 academic year alone.[989] Those investments create benefits for current employees, but they also establish visible expectations about what working for Wegmans means. The choices Wegmans has consistently made have earned it a sterling reputation, while also creating an expectation that those commitments will continue. A strong reputation creates influence and resilience, but preserving those advantages requires the institution to continue delivering the conduct stakeholders have learned to expect. The expectation tax is not simply a cost of reputational success. It is the recurring investment required to preserve the dividend that a strong reputation produces, sustaining the conduct and commitments that keep reputational success intact.

DOWNLOAD THE BOOK PROPOSAL

Failure to upkeep the expectation tax can be quite consequential. When an institution fails to maintain a pattern of choices and conduct that once built stakeholder collaboration, the result is a contradiction which can create reputational harm. This occurs when stakeholders are forced to reconcile what an institution has taught them to believe they should expect with evidence that suggests something different. Kickstarter provides a powerful example. In 2015, the crowdfunding platform reincorporated as a Public Benefit Corporation, formally committing itself to serving creators and the public good alongside financial interests.[990] Its charter pledged 5 percent of after-tax profits to arts education and organizations fighting systemic inequality while promising to support and champion artists and creators.[991] Those expectations became harder to reconcile when Kickstarter employees sought to unionize in 2019.[992] Management declined to voluntarily recognize the union and opposed the effort, and prominent organizers were later fired.[993] The employees alleged retaliation, which Kickstarter denied, and the dispute generated criticism from

creators who depended on the platform.[994] The contradiction became more visible in February 2020, when employees voted 46 to 37 to unionize, making Kickstarter one of the first major technology companies with a unionized white-collar workforce.[995] The cost was not the union itself, but the public gap between a charter built around serving creators and the public good and a management posture that many employees and creators read as inconsistent with it. The case shows how a contradiction tax emerges when institutions act against the expectations their own reputations helped create, forcing stakeholders to reconsider whether the institution still deserves the legitimacy it had earned.

Because mismanaged reputation is costly, it is often discussed through the pain points it creates, which is why it is so closely associated with the term crisis. The word is used so widely that its meaning varies from one institution to the next. Here, a crisis is a disruption to an institution's usual operations that threatens to significantly alter its

scale, capacity, or ability to continue functioning.[996] It generally reflects one of two conditions. In the first, stakeholder actions have constrained operations beyond the institution's normal capacity to absorb them, leaving its scale and capacity in decline. In the second condition, a rapidly escalating reputation risk poses an imminent threat[997] to scale, capacity, or performance if it is not addressed.[998] Crisis management can therefore be proactive,[999] preventing an escalating risk from producing critical harm, or reactive, relieving constraints that harm has already imposed.[1000] Reputation risk is a latent or emerging threat, reputational harm is the measurable consequence of stakeholder constraint, and crisis is the disruption of normal operations required to prevent or reverse critical damage.[1001]

CrossFit provides a strong example of a company thrown into crisis as a result of reputational harm. By 2020, the fitness company had built a global community of more than 14,000 affiliated gyms and a reputation strong enough to turn a workout routine into an international movement.[1002] Then founder and CEO Greg Glassman made comments following the murder of George Floyd that were widely criticized as racially insensitive, triggering rapid condemnation from athletes, gym owners, sponsors, and other members of the CrossFit community.[1003] More than 1,000 affiliates reportedly announced plans to sever their relationship with the company, Reebok ended negotiations to renew its sponsorship, prominent athletes distanced themselves from the brand, Glassman resigned as CEO, and within weeks the company was sold to new ownership.[1004] CrossFit could not absorb the reputational harm while preserving its existing leadership, stakeholder relationships, and operating scale. The company survived, but survival required extraordinary crisis management and a fundamental effort to rebuild.

The estimates of the costs that reputation creates and the gains that reputation provides will likely never be fully settled or universally agreed upon. What is less debatable are the consequences and conditions that reputation creates within stakeholder relationships. Institutions depend on stakeholders to choose, stay, contribute, permit, invest, advocate, forgive, and collaborate. The economics of reputation rest on a few key principles. First, reputation carries a cost in every position an institution occupies. Second, institutional leaders cannot eliminate that cost. Third, organizations can only decide where, when, and how they are willing to pay it. How those choices are made and how stakeholders judge that conduct determines the willingness of stakeholders to help institutions endure and advance.

The consequences of reputation should also be understood beyond any single stakeholder relationship. When institutions repeatedly fail to satisfy expectations across several stakeholders they increase the likelihood of conduct enforcement through standards, audits, contracts, disclosure requirements, restrictions, regulation, or law.[1005] Formal rules do not arise from reputational failure alone, nor does every unmet expectation automatically produce regulation. Rules are, however, one way societies replace insufficient voluntary behavior with enforceable mandates, and when

expectations go unmet across enough stakeholders for long enough, they often follow. The strategic question is whether institutions wait for those expectations to harden into resistance, constraint, or crisis, or do they bring stakeholder expectations into the decision process early enough to anticipate where the operating environment is moving. Reputation strategy therefore does not end with only measuring how stakeholders judge institutions. It must go beyond this to proactively understand what stakeholders expect before those expectations become the conditions under which the institution is forced to operate.

DOWNLOAD THE BOOK PROPOSAL

Reputation is a complex concept. The stakeholders who judge an institution resist uniformity and consistency, and that challenge is amplified by a chaotic signal environment and an uneven process of sensemaking and interpretation. Reputation does not live in one place, in one moment, with one stakeholder, responding to a single decision. It is far more than a score. It is a social system through which people determine whether to collaborate willingly or withdraw.

That system is difficult to make tangible because it forms through judgment. Judgments take shape gradually, across different experiences and different stakeholder expectations, and they are often hard to see. Stakeholder confidence may be eroding quietly. Stakeholders may be waiting for additional evidence before they act. Or they may be locked in a collaboration paradox, sustaining behavior that no longer reflects their genuine willingness. The arithmetic of reputation appears straightforward. Quantify the value of what stakeholders are willing to put into the institution, then subtract the costs they impose when they act to constrain it. But in practice, both sides of that equation are subjective and layered, which makes a consistently accurate valuation difficult to achieve.

DOWNLOAD THE BOOK PROPOSAL

This reveals one of reputation management's deepest ironies. Institutions often want an exact account of reputation's value before they invest in the infrastructure it needs. But reputation forms through complex social systems, so its effects are difficult to isolate and attribute with perfect causal certainty. The search for that certainty can become a pursuit of Moby Dick. Time and resources go toward proving exactly what reputation is worth, while the capability to detect changing expectations and interpret stakeholder judgments remains underbuilt or distracted. The irony deepens further when the proof that leaders demand never arrives in the form they expect, such as stock price movements, which further entrenches the rationale for not investing in the reputation infrastructure that would support long-term financial performance.

This explains why reputation is commonly understood in reverse. Its benefits, such as a willingness to pay a premium or extend the benefit of the doubt, accumulate gradually and remain largely unseen until difficult conditions and challenging decisions put them to work. Its costs, by contrast, are visible and immediate, whether in the infrastructure required to build it or in the consequences an institution faces after failing to manage it. Institutional values follow the same pattern. Neither reputation nor values can be built at the point of the decision test or once reputational harm has arrived. This is the core of reputation's central irony. By the

DOWNLOAD THE BOOK PROPOSAL

time its value to the institution becomes clear, it has already become more costly and more difficult to build.

What frustrates reputation managers is that even when reputation is well understood, control of it remains partial. An institution that understands its stakeholders, develops clear values, and makes sound choices still cannot fully determine its own reputation. It can shape its conduct and use communication to clarify the signals it sends, but those signals enter a crowded, polarized, and noisy environment where stakeholders interpret them through their own context and expectations. An institution can explain what it intended, but it cannot decide what its conduct means to everyone who encounters it. Reputation management, then, is less about controlling interpretation and more about understanding how expectations form and keeping conduct as closely aligned with them as possible.

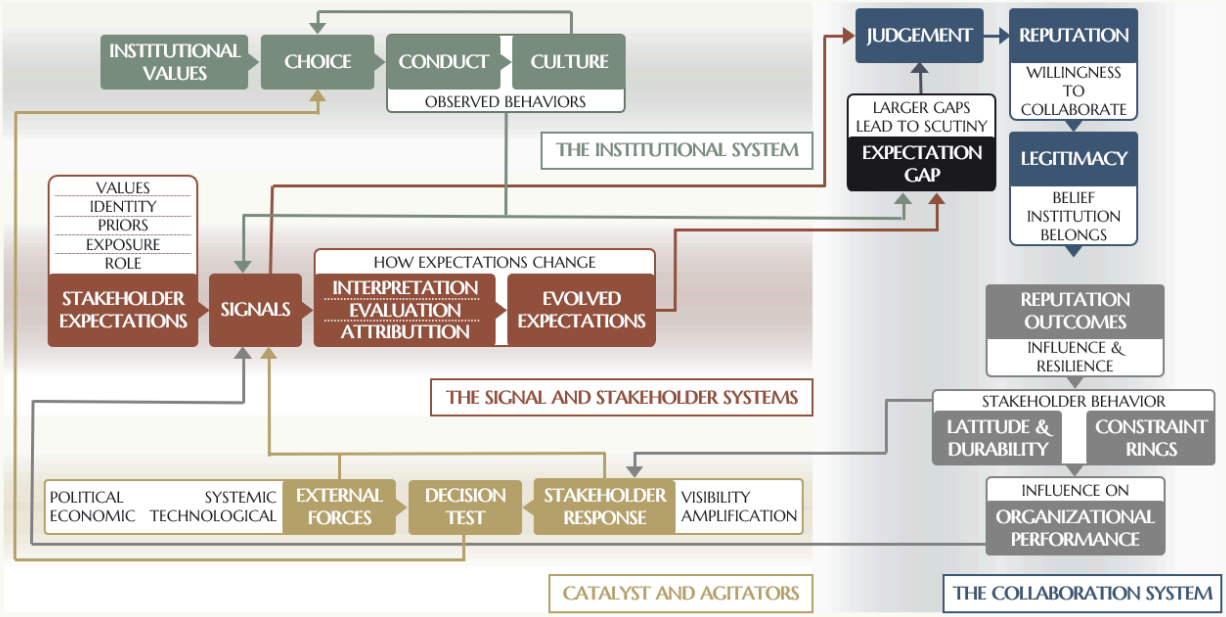
REPUTATION AS A CONTINUOUS COMPLEX SOCIAL SYSTEM



The anatomy of reputation emerges as a continuous, dynamic, and layered system of systems. A sequence can reveal the pattern it often follows. Values guide decisions. Decisions produce conduct. Conduct becomes a signal. Signals are judged against expectations. Judgment shapes willingness. Willingness produces influence and resilience. Influence and resilience lead to latitude and durability or constraint, which influences organizational performance. But the sequence is only a starting point. In practice, reputation does not move in one direction or along a singular path. Every stage eventually feeds back into itself as well as other reputation systems. Stakeholder responses become new signals. External forces create new decision tests. Culture shapes the next choice, and organizational performance itself becomes evidence

stakeholders use to revise their judgments. These dynamics unfold simultaneously, across many stakeholders, with each moving on different clocks.

A linear understanding helps explain how reputation works. But on its own, it cannot equip an institution to manage it. That gap matters because conduct is now judged faster, by more stakeholders, against expectations that institutions can struggle to keep up with. When those expectations go unmet long enough, they tend to harden into rules. Institutions that wait for that moment inherit an operating environment shaped by others. Those that anticipate it can still influence the terms. This is why reputation must be treated as infrastructure, capable of detecting expectation gaps before they become visible and informing decisions that demonstrate the integrity and prosperity an institution provides. The final section turns from how reputation works to how institutions can manage it in the Reputation Era.

Section 4: Reputation as an Infrastructure

Chapter 10: The Reputation Audit

- While reputational crises appear chaotic, most reputation risk is systematic. It emerges along visible fault lines where external pressures intersect with internal

vulnerabilities. It's baked into business models. Tech companies face data/privacy exposure. Pharma faces access/affordability exposure. Industrials face environmental degradation. Fashion faces labor exploitation.

- Incentive systems reward growth over foresight. Crises are factored as costs of doing business. Companies push ahead of governance gaps. As consequences become visible, pressure to regulate multiplies.
- The solution is to audit your business model for reputation risk. Not monitoring what customers say, but understanding and anticipating regulatory pressure.
- Integrate NGOs, think tanks, and research organizations as third-party auditors. They have distance from your incentive systems. They derisk the business at its weakest points and build credibility through independent scrutiny.
- Paul Polman (former Unilever CEO) would say “It takes courage”. But companies see transparency at vulnerable points as risk. The real risk is hiring consultants to quietly fix problems or conceal findings. That's damage control. It defers and amplifies delegitimizing crises.

Chapter 11: The False Binary: Perform Loud or Stay Silent

- Advocacy is one of the most effective ways for companies to bring their values to life. But companies are paralyzed. They say "If we speak up, we get attacked.

DOWNLOAD THE BOOK PROPOSAL

If we're silent, we look complicit. If we pick a side, we alienate half our stakeholders. Everything's been purpose-washed anyway, so why bother?"

- Advocacy doesn't fail because volume is wrong. It fails from lack of consistency and behavioral alignment. Companies over-index on words, under-index on patterns of commitment.
- The solution is authentic advocacy. It emerges when organizational decisions consistently reflect stated values. Not messaging about values. Decisions that embody them.
- Authentic advocacy removes paralysis. It matters less if an action offends someone. It matters that it's consistent. This consistency builds reputation in ways messaging never can.
- Authentic advocacy also prevents chasing trending issues. When you're tied to consistent values, you don't get pulled into misalignment and backlash.

DOWNLOAD THE BOOK PROPOSAL

Chapter 12: An Unresolved Reputation Mandate

- For a hundred years, companies have treated reputation as a communications problem. Companies hire brilliant people to manage messaging, spin narratives, and control stories. But this is not enough to endure the Reputation Era.
- At the same time, reputation has also been viewed as everyone's job and no one's job at the same time. It lives in communications, but comms can't make strategy decisions. It lives in legal, but legal only handles compliance, not proactive risk mitigation. It lives in operations, but operations optimizes for short-run efficiency, not long-term resilience.
- The fragmented, siloed nature of corporations means that a decision made in one function cannot carry a holistic understanding of how it impacts the reputation of the company.
- Reputation is often left with the communications function, but these teams do not have jurisdiction on corporate behavior.
- Companies need a Chief Reputation Officer or Reputation Committee. The mandate is to ensure alignment between strategy, values, and stakeholders.
- The emergence of stakeholder capitalism signals this is likely how the Reputation Era will end. Those that wait until stakeholder governance is codified into law will be forced to restructure reactively. A dedicated reputation function of the business is not a prediction, it's a preemption.
